Broadband Internet Access and the Digital Divide: Federal Assistance Programs

Summary

The “digital divide” is a term that has been used to characterize a gap between “information haves and have-nots,” or in other words, between those Americans who use or have access to telecommunications technologies (e.g., telephones, computers, the Internet) and those who do not. One important subset of the digital divide debate concerns high-speed Internet access, also known as *broadband*. Broadband is provided by a series of technologies (e.g. cable, telephone wire, satellite, wireless) that give users the ability to send and receive data at volumes and speeds far greater than current Internet access over traditional telephone lines.

Broadband technologies are currently being deployed by the private sector throughout the United States. While the numbers of new broadband subscribers continue to grow, studies conducted by the Federal Communications Commission (FCC), the Department of Commerce (DOC), and the Department of Agriculture (USDA) suggest that the rate of broadband deployment in urban and high income areas may be outpacing deployment in rural and low-income areas.

Some policymakers, believing that disparities in broadband access across American society could have adverse economic and social consequences on those left behind, assert that the federal government should play a more active role to avoid a “digital divide” in broadband access. One approach is for the federal government to provide financial assistance to support broadband deployment in underserved areas. Others, however, believe that federal assistance for broadband deployment is not appropriate. Some opponents question the reality of the “digital divide,” and argue that federal intervention in the broadband marketplace would be premature and, in some cases, counterproductive.

Legislation introduced into the 107th Congress seeks to provide federal financial assistance for broadband deployment in the form of grants, loans, subsidies, and tax credits. In assessing this legislation, several policy issues arise. For example, is the current status of broadband deployment data an adequate basis on which to base policy decisions? Given the early stages of broadband deployment, is federal assistance premature, or do the risks of delaying assistance to underserved areas outweigh the benefits of avoiding federal intervention in the marketplace? And finally, if one assumes that governmental action is necessary to spur broadband deployment in underserved areas, which specific approaches, either separately or in combination, are likely to be most effective?

Broadband Internet Access and the Digital Divide: Federal Assistance Programs

Background

The “digital divide” is a term used to describe a perceived gap between perceived “information haves and have-nots,” or in other words, between those Americans who use or have access to telecommunications technologies (e.g., telephones, computers, the Internet) and those who do not.¹ Whether or not individuals or communities fall into the “information haves” category depends on a number of factors, ranging from the presence of computers in the home, to training and education, to the availability of affordable Internet access. A widely cited series of reports issued by the Department of Commerce² during the Clinton Administration argued that a “digital divide” exists, with many rural citizens, certain minority groups, and low-income Americans tending to have less access to telecommunications technology than other Americans.³

In February 2002, the Bush Administration’s Department of Commerce released its first survey report on Internet use, entitled *A Nation Online: How Americans Are Expanding Their Use of the Internet*.⁴ While acknowledging a disparity in usage between “information haves and have nots,” the report focused on the increasing rates of Internet usage among traditionally underserved groups:

In every income bracket, at every level of education, in every age group, for people of every race and among people of Hispanic origin, among both men and women, many more people use computers and the Internet now than did so in the recent past. Some people are still more likely to be Internet users than others. Individuals living in low-income households or having little education, still trail the national average. However, broad measures of Internet use in the United States suggest that over time Internet use has become more equitable.⁵

¹ The term “digital divide” can also refer to international disparities in access to information technology. This report focuses on domestic issues only.

² See: U.S. Department of Commerce, *Falling Through the Net: Toward Digital Inclusion*, released October 2000, available at: [<http://www.esa.doc.gov/fttn00.pdf>]

³ Not all observers agree that a “digital divide” exists. See, for example: Thierer, Adam D., *Divided Over the Digital Divide*, Heritage Foundation, March 1, 2000. [<http://www.heritage.org/views/2000/ed030100.html>]

⁴ Department of Commerce, *A Nation Online: How Americans Are Expanding Their Use of the Internet*, February 2002. Based on a September 2001 Census Bureau survey of 57,000 households. See: [<http://www.ntia.doc.gov/ntiahome/dn/index.html>]

⁵ *A Nation Online*, pp. 10-11.

One important subset of the digital divide debate concerns high speed Internet access, also known as *broadband*. Broadband is provided by a series of technologies (e.g. cable, telephone wire, satellite, wireless) that give users the ability to send and receive data at volumes and speeds far greater than current Internet access over traditional telephone lines.⁶ In addition to offering speed, broadband access provides a continuous, “always on” connection (no need to dial-up) and a “two-way” capability, that is, the ability to both receive (download) and transmit (upload) data at high speeds.

Broadband technologies are being deployed by the private sector throughout the United States. A September 2001 survey conducted by the Department of Commerce found that 10.8% of the population and 20.0% of household Internet users have high-speed Internet connections in their homes.⁷ The Federal Communications Commission (FCC) *Third Report* on advanced telecommunications capability (released February 6, 2002) reported that as of June 30, 2001 there were 9.6 million high speed lines connecting homes and businesses to the Internet in the United States, a growth rate of 250% over the numbers reported in the FCC’s Second Report released eighteen months earlier.⁸ According to a June 2001 Gartner Dataquest survey, just less than 25% of online households have high speed Internet access. On the other hand, while broadband *adoption* rates remain relatively low, broadband *availability* is much higher. According to J.P. Morgan and McKinsey & Co., 73% of households have cable modem service available, and 45% of households have access to DSL. Combined, availability of at least one broadband provider is estimated to be almost 85%. However, only 12% of households with available access to broadband have chosen to subscribe.⁹

More specific and recent data exist for subscriptions over telephone lines and cable, currently the two principal competing broadband technologies. According to Kinetic Strategies Inc., a broadband research firm, an estimated 9.0 million households in the United States subscribed to cable modem¹⁰ services by the end of June 2002, while 4.4 million households subscribed to digital subscriber line (DSL)¹¹ service. Kinetic Strategies estimates that cable modem and DSL penetration of U.S. households stands at over 13%.¹²

⁶ For further information on different types of broadband technologies, including their respective strengths and limitations, see: CRS Issue Brief IB10045, *Broadband Internet Access: Background and Issues*.

Broadband in Rural and Low-Income Areas. While the number of new broadband subscribers continues to grow, the rate of broadband deployment in urban and high income areas appears to be outpacing deployment in rural and low-income areas. In response to a request by ten Senators, the Departments of Commerce and Agriculture released a report on April 26, 2000, concluding that rural areas lag behind urban areas in access to broadband technology. The report found that less than 5% of towns of 10,000 or less have access to broadband, while broadband over cable has been deployed in more than 65% of all cities with populations over 250,000, and broadband over the telephone network has been deployed in 56% of all cities with populations over 100,000.¹³

The FCC's *Third Report* found that while broadband is being deployed throughout the United States in a reasonable and timely fashion overall, "certain factors – such as population density and income – continue to be highly correlated with the availability of high-speed services."¹⁴ Specifically, as of June 30, 2001, the FCC found at least one high-speed subscriber in 78% of all zip codes in the United States. High-speed subscribers were reported in 97% of the most densely populated zip codes, as opposed to 49% of zip codes with the lowest population densities. Similarly, for zip codes ranked by median family income, high-speed subscribers were reported present in 96% of the top one-tenth of zip codes, as compared to 59% of the bottom one-tenth of zip codes.¹⁵

Finally, the February 2002 report from the Department of Commerce, *A Nation Online: How Americans Are Expanding Their Use of the Internet*, found that 12.2% of Internet users in rural areas had high-speed connections, as opposed to 21.2% of Internet users in urban areas. The report's survey also found, not surprisingly, that individuals in high-income households have higher broadband subscribership rates than individuals in lower income households.¹⁶

Some policymakers believe that disparities in broadband access across American society could have adverse consequences on those left behind. While relatively few American homes today subscribe to broadband, many believe that advanced Internet applications of the future – high quality video, for example – and the resulting ability for businesses and consumers to engage in e-commerce, may increasingly depend on high speed broadband connections to the Internet. Thus, some say, communities and individuals without access to broadband could be at risk to the extent that e-commerce becomes a critical factor in determining future economic development and prosperity.

Federal Role. The Telecommunications Act of 1996 (P.L. 104-104) addresses the issue of whether the federal government should intervene to prevent a "digital

¹³ See: U.S. Depts. of Commerce and Agriculture, *Advanced Telecommunications in Rural America: The Challenge of Bringing Broadband Service to All Americans*, April 2000, 80 pages. Available at: [<http://www.ntia.doc.gov/reports/ruralbb42600.pdf>]

¹⁴ FCC, *Third Report*, p. 5.

¹⁶ *A Nation Online*, pp. 40-41.

divide” in broadband access. Section 706 requires the FCC to determine whether “advanced telecommunications capability [i.e., broadband or high-speed access] is being deployed to all Americans in a reasonable and timely fashion.” If this is not the case, the Act directs the FCC to “take immediate action to accelerate deployment of such capability by removing barriers to infrastructure investment and by promoting competition in the telecommunications market.”

On January 28, 1999, the FCC adopted its first report (FCC 99-5) pursuant to Section 706. The report concluded that “the consumer broadband market is in the early stages of development, and that, while it is too early to reach definitive conclusions, aggregate data suggests that broadband is being deployed in a reasonable and timely fashion.”¹⁷ The FCC announced that it would continue to monitor closely the deployment of broadband capability in annual reports and that, where necessary, it would “not hesitate to reduce barriers to competition and infrastructure investment to ensure that market conditions are conducive to investment, innovation, and meeting the needs of all consumers.”

The FCC’s second Section 706 report was adopted on August 3, 2000. Based on more extensive data than the first report, the FCC similarly concluded that notwithstanding risks faced by some vulnerable populations, broadband is being deployed in a reasonable and timely fashion overall:

Recognizing that the development of advanced services infrastructure remains in its early stages, we conclude that, overall, deployment of advanced telecommunications capability is proceeding in a reasonable and timely fashion. Specifically, competition is emerging, rapid build-out of necessary infrastructure continues, and extensive investment is pouring into this segment of the economy.¹⁸

The FCC’s third Section 706 report was adopted on February 6, 2002. Again, the FCC concluded that “the deployment of advanced telecommunications capability to all Americans is reasonable and timely.”¹⁹ The FCC added:

We are encouraged by the expansion of advanced services to many regions of the nation, and growing number of subscribers. We also conclude that investment in infrastructure for most advanced services markets remains strong, even though the pace of investment trends has generally slowed. This may be due in part to the general economic slowdown in the nation. In addition, we find that emerging technologies continue to stimulate competition and create new alternatives and choices for consumers.²⁰

While the FCC is currently implementing or actively considering some regulatory activities related to broadband,²¹ no major regulatory intervention pursuant to Section 706 of the Telecommunications Act of 1996 has been deemed necessary by the FCC at this time. Meanwhile, the National Telecommunications and Information Administration (NTIA) at the Department of Commerce (DOC) was tasked with developing the Bush Administration's broadband policy.²² While the Administration's official broadband policy has not yet been formally unveiled, statements from Administration officials indicate that much of the policy will focus on removing regulatory roadblocks to investment in broadband deployment.²³ On June 13, 2002, in a speech at the 21st Century High Tech Forum, President Bush declared that the nation must be aggressive about the expansion of broadband, and cited ongoing activities at the FCC as important in eliminating hurdles and barriers to get broadband implemented.

The Bush Administration has also emphasized the importance of encouraging demand for broadband services. On September 23, 2002, the DOC's Office of Technology Policy released a report, *Understanding Broadband Demand: A Review of Critical Issues*,²⁴ which argues that national governments can accelerate broadband demand by taking a number of steps, including: protecting intellectual property, supporting business investment, developing e-government applications, promoting efficient radio spectrum management, and others. Similarly, the President's Council of Advisers on Science & Technology (PCAST) was tasked with studying "demand-side" broadband issues, such as whether reforms are necessary regarding intellectual property or digital rights management in order to spur the availability of "killer-applications" on broadband networks. The PCAST report concludes that while government should not intervene in the telecommunications marketplace, it should apply existing policies and work with the private sector to promote broadband applications and usage. Specific initiatives include increasing e-government broadband applications (including homeland security), promoting telework, and pursuing broadband-friendly spectrum policies.²⁵

²⁵ Rucker, Terri, "Broadband: President's Advisors Oppose Intervention in Broadband Market," *Technology Daily*, September 30, 2002.

Meanwhile, “high-tech” organizations such as TechNet²⁶ and the Computer Systems Policy Project (CSPP)²⁷ have called on the federal government to adopt policies toward a goal of 100 Mbps to 100 million homes by the end of the decade. A bill introduced by Senator Lieberman on June 5, 2002 (S. 2582, National Broadband Strategy Act of 2002) requires the President to submit a report to Congress setting forth a comprehensive strategy for the nationwide deployment of high speed broadband Internet telecommunications services.

Some policymakers in Congress assert that the federal government should play a more active role to avoid a “digital divide” in broadband access, and that legislation is necessary to ensure fair competition and timely broadband deployment. To accomplish this goal, the Congress is considering a number of legislative approaches. First, Congress is considering whether to ease certain legal restrictions and requirements, imposed by the Telecommunications Act of 1996, on incumbent telephone companies that provide high-speed data (broadband) access. For more information on this legislation (e.g. H.R. 1542, popularly referred to as “Tausin-Dingell,” and S. 2430, “Breux-Nickles”), see CRS Issue Brief IB10045, *Broadband Internet Access: Background and Issues*.

Another approach involves federal assistance to support broadband deployment in underserved areas. Numerous bills have been introduced into the 107th Congress seeking to provide federal financial assistance for broadband deployment in the form of grants, loans, subsidies, and/or tax credits.

Federal Telecommunications Development Programs

Table 1 (at the end of this report) shows selected federal domestic assistance programs throughout the federal government that can be associated with telecommunications development. Many (if not most) of these programs can be related, if not necessarily to the deployment of broadband technologies in particular, then to the “digital divide” issue generally.

The Universal Service Concept and the FCC.²⁸ Since its creation in 1934 the Federal Communications Commission (FCC) has been tasked with “... mak[ing] available, so far as possible, to all the people of the United States, ... a rapid, efficient, Nation-wide, and world-wide wire and radio communications service

²⁶ TechNet represents over 300 senior executives from companies in the fields of information technology, biotechnology, venture capital, investment banking, and law. TechNet’s policy document, “A National Imperative: Universal Availability of Broadband by 2010,” is available at: [<http://www.technet.org/news/newsreleases/2002-01-15.64.pdf>]

²⁷ CSPP is composed of nine CEOs from computer hardware and information technology companies. See: “A Vision for 21st Century Wired & Wireless Broadband: Building the Foundation of the Networked World,” [<http://www.cspp.org/reports/networkedworld.pdf>]

²⁸ The section on universal service was prepared by Angele Gilroy, Specialist in Telecommunications Policy, Resources, Science and Industry Division.

with adequate facilities at reasonable charges....”²⁹ This mandate led to the development of what has come to be known as the universal service concept.

The universal service concept, as originally designed, called for the establishment of policies to ensure that telecommunications services are available to all Americans, including those in rural, insular and high cost areas, by ensuring that rates remain affordable. Over the years this concept fostered the development of various FCC policies and programs to meet this goal. The FCC offers universal service support through a number of direct mechanisms that target both providers of and subscribers to telecommunications services.³⁰

The development of the federal universal service high cost fund is an example of provider-targeted support. Under the high cost fund, eligible telecommunications carriers, usually those serving rural, insular and high cost areas, are able to obtain funds to help offset the higher than average costs of providing telephone service.³¹ This mechanism has been particularly important to rural America where the lack of subscriber density leads to significant costs. FCC universal service policies have also been expanded to target individual users. Such federal programs include two income-based programs, Link Up and Lifeline, established in the mid-1980s to assist economically needy individuals. The Link Up program assists low-income subscribers pay the costs associated with the initiation of telephone service and the Lifeline program assists low-income subscribers pay the recurring monthly service charges. Funding to assist carriers providing service to individuals with speech and/or hearing disabilities is also provided through the Telecommunications Relay Service Fund. Effective January 1, 1998, schools, libraries, and rural health care providers also qualified for universal service support.

Universal Service and the Telecommunications Act of 1996. Passage of the Telecommunications Act of 1996 (P.L.104-104) codified the long-standing commitment by U.S. policymakers to ensure universal service in the provision of telecommunications services.

The Schools and Libraries, and Rural Health Care Programs. Congress, through the 1996 Act, not only codified, but also expanded the concept of universal service to include, among other principles, that elementary and secondary schools and classrooms, libraries, and rural health care providers have access to telecommunications services for specific purposes at discounted rates. (See Sections 254(b)(6) and 254(h) of the 1996 Telecommunications Act, 47 USC 254.)

1. **The Schools and Libraries Program.** Under universal service provisions contained in the 1996 Act, elementary and secondary schools and classrooms and libraries are designated as beneficiaries of universal service discounts. Universal

²⁹ Communications Act of 1934, As Amended, Title I sec.1[47 U.S.C. 151].

³⁰ Many states participate in or have programs that mirror FCC universal service mechanisms to help promote universal service goals within their states.

³¹ Additional FCC policies such as rate averaging and pooling have also been implemented to assist high cost carriers.

service principles detailed in Section 254(b)(6) state that “Elementary and secondary schools and classrooms ... and libraries should have access to advanced telecommunications services...” The Act further requires in Section 254(h)(1)(B) that services within the definition of universal service be provided to elementary and secondary schools and libraries for education purposes at discounts, that is at “rates less than the amounts charged for similar services to other parties.”

The FCC established the Schools and Libraries Division within the Universal Service Administrative Company (USAC) to administer the schools and libraries or “E (education)-rate” program to comply with these provisions. Under this program, eligible schools and libraries receive discounts ranging from 20 to 90 percent for telecommunications services depending on the poverty level of the school’s (or school district’s) population and its location in a high cost telecommunications area. Three categories of services are eligible for discounts: internal connections (e.g. wiring, routers and servers); Internet access; and telecommunications and dedicated services, with the third category receiving funding priority. According to data released by program administrators, over \$6 billion in funding has been committed over the first three years of the program with funding released to all states, the District of Columbia and all territories. Funding Year 2001 commitments, as of October 15, 2002, totaled \$2.3 billion.³² The most recent funding year, 2002, commitments totaled \$1.4 billion, as of October 16, 2002.

2. The Rural Health Care Program. Section 254(h) of the 1996 Act requires that public and non-profit rural health care providers have access to telecommunications services necessary for the provision of health care services at rates comparable to those paid for similar services in urban areas. Subsection 254(h)(1) further specifies that “to the extent technically feasible and economically reasonable” health care providers should have access to advanced telecommunications and information services. The FCC established the Rural Health Care Division (RHCD) within the USAC to administer the universal support program to comply with these provisions. Under FCC established rules only public or non-profit health care providers are eligible to receive funding. Eligible health care providers, with the exception of those requesting only access to the Internet, must also be located in a rural area.³³ The funding ceiling, or cap, for this support was established at \$400 million annually. The funding level for Year One of the program (January 1998 - June 30, 1999) was set at \$100 million. Due to less than anticipated demand, the FCC established a \$12 million funding level for the second year (July 1, 1999 to June 30, 2000) of the program but has returned to a \$400 million cap for the three most recent years. As of October 18, 2002, covering the first 5 years of the program, a total of \$39.4 million has been committed to 1,496 health care providers.

³² For information on the status, funding and implementation of the program see CRS Issue Brief IB98040, *Telecommunications Discounts for Schools and Libraries: The “E-Rate” Program and Controversies*, by Angele A. Gilroy.

³³ Any health care provider that does not have toll-free access to the Internet can receive the lesser of \$180 in toll charges per month or the toll charges incurred for 30 hours of access to the Internet per month. To obtain this support the health care provider does not have to be located in a rural area, but must show that it lacks toll-free Internet access and that it is an eligible health care provider.

The primary use of the funding is to provide reduced rates for telecommunications services to support telemedicine or telehealth programs.³⁴

The Telecommunications Development Fund. Section 714 of the 1996 Act created the Telecommunications Development Fund (TDF). The TDF is a private, non-governmental, venture capital corporation overseen by a seven-member board of directors and fund management. The purpose of the TDF is threefold: to promote access to capital for small businesses in order to enhance competition in the telecommunications industry; to stimulate new technology development and promote employment and training; and to support universal service and enhance the delivery of telecommunications services to rural and underserved areas. The TDF is authorized to provide financing to eligible small businesses in the telecommunications industry through loans and investment capital. At this time the TDF is focusing on providing financing in the form of equity investments ranging from \$375,000 to \$1 million per investment.³⁵ Initial funding for the program is derived from the interest earned from the upfront payments bidders submit to participate in FCC auctions. The availability of funds for future investments is dependent on earning a successful return on the Fund's portfolio. As of October 2002, the TDF had \$50 million under management of which approximately \$12-15million is committed to twelve portfolio companies.³⁶

Universal Service and Broadband. One of the policy debates surrounding universal service is whether access to advanced telecommunications services (i.e. broadband) should be incorporated into universal service objectives. The term universal service, when applied to telecommunications, refers to the ability to make available a basket of telecommunications services to the public, across the nation, at a reasonable price. As directed in the 1996 Telecommunications Act [Section 254(c)] a federal-state Joint Board was tasked with defining the services which should be included in the basket of services to be eligible for federal universal service support; in effect using and defining the term "universal service" for the first time. The Joint Board's recommendation, which was subsequently adopted by the FCC in May 1997, included the following in its universal services package: voice grade access to and some usage of the public switched network; single line service; dual tone signaling; access to directory assistance; emergency service such as 911; operator services; access and interexchange (long distance) service.

Some policy makers expressed concern that the FCC-adopted definition is too limited and does not take into consideration the importance and growing acceptance of advanced services such as broadband and Internet access. They point to a number of provisions contained in the Universal Service section of the 1996 Act to support their claim. Universal service principles contained in Section 254(b)(2) state that "Access to advanced telecommunications services should be provided to all regions

³⁴ For additional information on this program including funding commitments see the RHCD web site: [<http://www.rhc.universalservice.org>]

³⁵ The TDF also provides management and technical assistance to the companies in which it invests.

³⁶ For additional information on this program see the TDF web site at: [<http://www.tdfund.com>]

of the Nation.” The subsequent principle (b)(3) calls for consumers in all regions of the Nation including “low-income” and those in “rural, insular, and high cost areas” to have access to telecommunications and information services including “advanced services” at a comparable level and a comparable rate charged for similar services in urban areas. Such provisions, they state, dictate that the FCC expand its universal service definition.

Others caution that a more modest approach is appropriate given the “universal mandate” associated with this definition and the uncertainty and costs associated with mandating nationwide deployment of such advanced services as a universal service policy goal. Furthermore they state the 1996 Act does take into consideration the changing nature of the telecommunications sector and allows for the universal service definition to be modified if future conditions warrant. Section 254(c) of the Act states that “universal service is an evolving level of telecommunications services” and the FCC is tasked with “periodically” reevaluating this definition “taking into account advances in telecommunications and information technologies and services.” Furthermore, the Joint Board is given specific authority to recommend “from time to time” to the FCC modification in the definition of the services to be included for federal universal service support. The Joint Board, in July 2002, concluded such an inquiry and recommended that at this time no changes be made in the current list of services eligible for universal service support.

Rural Utilities Service. The Rural Electrification Administration (REA), subsequently renamed the Rural Utilities Service (RUS), was established by the Roosevelt Administration in 1935. Initially, it was established to provide credit assistance for the development of rural electric systems. In 1949, the mission of REA was expanded to include rural telephone providers. Congress further amended the Rural Electrification Act in 1971 to establish within REA a Rural Telephone Account and the Rural Telephone Bank (RTB). The RTB is described as a public-private partnership intended to provide additional sources of capital that will supplement loans made directly by RUS. Another program, the Distance Learning and Telemedicine Program, specifically addresses the needs engendered by passage of the Telecommunications Act of 1996 (P.L. 104-104). Its passage has contributed to an increase in demand for telecommunications loans. Currently, the RUS is in the process of modifying its regulations in order to allow it to use more of its lending authority to encourage private sector investment in rural broadband services.³⁷

Telecommunications Loans. This program makes three kinds of loans depending upon the financial condition of the borrowing utility and the costs associated with serving subscribers in rural areas. Hardship loans bear an interest rate of 5% and are intended for smaller utility systems in the most remote areas where there are fewer subscribers per mile of line. The second category of loans is RUS “cost-of-money” and RTB loans. These are made concurrently to a borrower, with the funds drawn from RUS and RTB in proportion to the respective annual appropriation to each. These loans carry an interest rate equal to its “cost of capital,”

³⁷ See, for example: Department of Agriculture, Rural Utilities Service, General Policies, Types of Loans, Loan Requirements – Telecommunications Program, Final Rule, Federal Register, Vol. 65, no. 175, September 8, 2000, p. 54399.

which is roughly the U.S. Treasury's cost of funds. Lastly, there are loans administered by RUS but guaranteed by the Federal Financing Bank (FFB), where the interest rate is set by agreement between the borrower and the private lender.

The Bush Administration, in its FY2002 budget proposal, requested the identical level of funding for the Telecommunications Loans program as was appropriated in FY2001 (\$75 million in hardship loan authority, \$300 million in Treasury-rate loans, and \$120 million for guaranteed loans). However, the FY2002 budget proposal requested no federal funding for the Rural Telephone Bank, in order to "continue the progression of the RTB toward becoming a private bank." The FY2002 Agriculture Appropriations bill (P.L. 107-76) appropriated the same level as requested by the Administration for the Telecommunications Loan program, and a loan level of \$175 million for the RTB.

Identical to the FY2002 request, the Administration's FY2003 budget proposal requested \$75 million in hardship loan authority, \$300 million in Treasury-rate loans, \$120 million for guaranteed loans, and no federal funding for the Rural Telephone Bank. Both the House and Senate versions of the FY2003 Agriculture Appropriations bill (H.Rept. 107-623, S.Rept. 107-223) would set the same level as requested by the Administration for the Telecommunications Loan program, and a loan level of \$175 million for the RTB.

Distance Learning and Telemedicine Program. This program³⁸ provides seed money for loans and grants to rural community facilities (e.g., schools, libraries, hospitals) for advanced telecommunications systems that can provide health care and educational benefits to rural areas. Appropriations for loans and grants in this program have increased significantly since its inception in 1993.

For FY2002, the Bush Administration proposed \$100 million for broadband treasury rate loans and \$2 million in broadband grants. The funding would be used as a grant/loan combination to finance installation of rural broadband capacity provided by RUS telecommunication cooperatives and businesses serving rural areas and communities. The funding could also be used to finance local dial-up Internet service for communities that currently lack Internet access via a local call. The FY2002 Agriculture Appropriations conference agreement (H.Rept. 107-275, P.L. 107-76) appropriated \$80 million for the principal amount of broadband telecommunications loans and \$22.5 million for the continuation of a pilot project for a loan and grant program (\$12.5 million is specifically for grants) to finance broadband transmission and local dial-up Internet service in rural areas. P.L. 107-76 also authorized the Secretary of Agriculture to make grants to regulatory commissions in States with communities without dial-up Internet access to establish a competitively neutral grant program to telecommunications carriers that establish facilities and services which will result in the long-term availability to rural communities of affordable broadband telecommunications services. The availability of FY2002 grant money (\$10 million pilot program) for broadband service in rural

³⁸ 7 U.S.C. 950aaa et seq.

communities was announced by RUS on July 8, 2002.³⁹ RUS is accepting applications for these grants through November 5, 2002.

For FY2003, the Administration is proposing \$80 million for broadband treasury rate loans and \$2 million for broadband grants. Both the House and Senate versions of the FY2003 Agriculture Appropriations bill (H.Rept. 107-623, S.Rept. 107-223) would provide a loan level of \$80 million for broadband telecommunications direct loans. The Senate bill would specify \$10 million in grants for broadband transmission and local Internet dial-up service.

Meanwhile, the Farm Security and Rural Investment Act of 2002 (P.L. 107-171) authorized a loan and loan guarantee program to eligible entities for facilities and equipment providing broadband service in rural communities. Section 6103 authorized a total of \$100 million through FY2007 (\$20 million for each of fiscal years 2002 through 2005, and \$10 million for each of fiscal years 2006 and 2007). RUS is currently developing regulations to implement the new broadband loan program. Details are expected to be released in November 2002.

Department of Commerce Programs. The Technology Opportunities Program (TOP), formerly the Telecommunications and Information Infrastructure Assistance Program (TIAPP), is administered by the National Telecommunications and Information Administration (NTIA) at the Department of Commerce. TOP gives grants for model projects demonstrating innovative uses of advanced telecommunications technologies, especially in rural and underserved communities. Matching grants are awarded to state, local and tribal governments, health care providers, schools, libraries, police departments, and community-based non-profit organizations. Applications include distance learning, telemedicine, and economic development.

Since 1994, TOP has awarded 555 grants, totaling \$204.9 million and leveraging \$282 million in local matching funds. As broadband technologies become increasingly developed and deployed, it is likely that an increasing number of TOP grants will be related to broadband deployment. In FY2002, TOP awarded \$12.4 million to 25 organizations.⁴⁰

The Bush Administration's FY2002 budget proposal requested \$15.5 million for TOP in FY2002. This constitutes a 66% cut from TOP's FY2001 appropriated level. The FY2002 Commerce-Justice-State Appropriations Act (P.L. 107-77) provided \$15.5 million for TOP, the same level of funding proposed by the Administration.

In its FY2003 budget submission, the Administration proposes to terminate the TOP program. The Senate Commerce-Justice-State appropriations bill for FY2003 (S.Rept. 107-218) would provide TOP with \$15.56 million in FY2003.

Legislation in the 107th Congress

A number of bills have been introduced in the 107th Congress which seek to provide financial support for broadband deployment, especially in rural and/or low-income areas. Some provisions would authorize funding for loans and grants, while others would establish targeted tax credits for companies investing in broadband facilities.⁴¹ The Senate Budget Committee-passed FY2003 budget resolution (S.Con.Res.100) includes a “Sense of the Senate Regarding Broadband Capabilities for Underserved Areas” (Section 303). The provision finds that broadband is not deployed or adequately utilized in rural and other underserved areas, and calls on Congress to encourage deployment of and demand for broadband technologies in those areas.

The Senate version of the farm bill – S. 1731 (Harkin) – contained language authorizing the Secretary of Agriculture to provide grants and loans to eligible entities providing broadband service in rural areas. Subsequently, the final farm bill conference agreement (H.Rept.107-424; H.R.2646/S. 1731, the Farm Security and Rural Investment Act of 2002) authorizes the Secretary of Agriculture to make loans and loan guarantees to eligible entities for facilities and equipment providing broadband service in rural communities. Section 6103 authorizes a total of \$100 million through FY2007 (\$20 million for each of fiscal years 2002 through 2005, and \$10 million for each of fiscal years 2006 and 2007). The Farm Bill was signed into law (P.L. 107-171) on May 13, 2002.

Meanwhile, a broadband tax credit provision was added to the Senate Finance Committee version of the economic stimulus bill, H.R. 3090 (Economic Security and Recovery Act of 2001). Modeled on S. 88 (the Broadband Internet Access Act introduced by Senator Rockefeller), section 902 of H.R. 3090 would have provided a 10% credit for deploying “current generation” broadband equipment in rural and underserved areas and a 20% credit for “next generation” broadband equipment deployment for rural and underserved areas and for all residential broadband subscribers. Ultimately, H.R. 3090 was not passed by the Senate.

Subsequently, similar broadband tax credit language was considered as a possible amendment to the Senate energy bill (S. 517). In the end, this amendment was not included in the final version of the energy bill passed by the Senate on April 25, 2002. It is possible that broadband tax credit language could be attached to another legislative vehicle in the Senate before the end of the 107th Congress.⁴²

The Broadband Telecommunications Act of 2002 (S. 2430) was introduced by Senator Hollings on May 2, 2002. S. 2448 would provide financial assistance for an array of programs and initiatives to encourage broadband deployment, particularly

⁴¹ For information on broadband legislation which addresses regulatory issues such as lifting data transmission restrictions on Bell Operating Companies, and “open access” of cable systems, please see the CRS Issue Brief IB10045, *Broadband Internet Access: Background and Issues*.

⁴² See Senate debate on Broadband Tax Credit Legislation, *Congressional Record*, April 25, 2002, pp. S3399-S3404.

in rural and underserved areas. Specifically, the bill would establish a Broadband Deployment and Demand Trust Fund financed by monies from the telephone excise tax. For each of years FY2003 through FY2007, expenditures from the Trust Fund would be used for a number of purposes, including: grants and loans for broadband deployment; pilot projects for wireless and other non-wireline broadband technologies; block grants to States and local governments to encourage and support broadband deployment; grants to the National Institute of Standards and Technology (NIST), NTIA, the National Science Board, and universities to conduct research on next-generation broadband technologies; grants to connect underrepresented colleges and communities to the Internet; grants for digital television conversion by public broadcasters; and grants for programs aimed at stimulating broadband demand, such as digitizing library and museum collections, developing consumer applications, and developing e-government initiatives. In total, S. 2448 would authorize expenditures of up to \$10.87 billion through FY2007 (\$2.17 billion per year, FY2003 – FY2007).

The following is a complete listing of bills introduced in the 107th Congress which seek to provide some form of financial assistance to encourage broadband deployment:

H.R. 267 (English)

Broadband Internet Access Act of 2001. Provides tax credits for five years to companies investing in broadband equipment. Provides a 10% tax credit for “current generation” broadband service (defined as download speeds of at least 1.5 million bits per second) for rural and low-income areas, and a 20% tax credit for “next generation” broadband service (defined as download speeds of at least 22 million bits per second). Introduced January 30, 2001; referred to Committee on Ways and Means.

H.R. 1415 (Rangel)

Technology Bond Initiative of 2001. Provides an income tax credit to holders of bonds financing the deployment of broadband technologies. Introduced April 4, 2001; referred to Committee on Ways and Means.

H.R. 1416 (LaFalce)

Broadband Expansion Grant Initiative of 2001. Authorizes \$100 million in grants and loan guarantees from the Department of Commerce for deployment by the private sector of broadband telecommunications networks and capabilities to underserved rural areas. Introduced April 4, 2001; referred to Committee on Energy and Commerce.

H.R. 1693 (Hall)

Science Education for the 21st Century Act. Authorizes \$10 million in each of fiscal years 2002 through 2004 for federal agencies participating in the Next Generation Internet program to conduct broadband demonstration projects in elementary and secondary schools. Directs the National Science Foundation to conduct a study of broadband network access in schools and libraries. Introduced May 3, 2001; referred to Committees on Science and on Education and Workforce.

H.R. 1697 (Conyers)

Broadband Competition and Incentives Act of 2001. Authorizes \$3 billion for a loan program administered by the Department of Justice to finance broadband deployment in rural and low-income areas. Introduced May 3, 2001; referred to Committees on Judiciary and on Energy and Commerce.

H.R. 2038 (Stupak)

Rural Broadband Enhancement Act. Gives new authority to the Rural Utilities Service in consultation with the National Telecommunications and Information Administration to make low interest loans to companies that are deploying broadband technology in rural areas. Introduced May 25, 2001; referred to Committee on Energy and Commerce and Committee on Agriculture.

H.R. 2139 (Smith)

Rural America Broadband Deployment Act. Authorizes the Secretary of Agriculture to make loans for the development of broadband services in rural areas. Introduced June 12, 2001; referred to Committee on Agriculture and Committee on Energy and Commerce.

H.R. 2401 (McHugh)

Rural America Digital Accessibility Act. Provides for grants, loans, research, and tax credits to promote broadband deployment in underserved rural areas. Introduced June 28, 2001; referred to Committee on Energy and Commerce, Committee on Ways and Means, and Committee on Science.

H.R. 2597 (McInnis)

Broadband Deployment and Telework Incentive Act. Allows taxpayer deductions for purchase of broadband equipment and provides tax credits to providers of next generation broadband service to rural and urban subscribers. Introduced July 23, 2001; referred to Committee on Ways and Means.

H.R. 2669 (Moran)

Rural Telecommunications Enhancement Act. Authorizes the Secretary of Agriculture to make loans and grants to improve access to telecommunications and Internet services in rural areas. Introduced July 27, 2001; referred to Committee on Agriculture and Committee on Energy and Commerce.

H.R. 2847 (Boswell)

Rural America Technology Enhancement Act of 2001. Provides: tax credits for broadband facilities development; rural area broadband support through the FCC's universal service fund; and loans from the USDA Rural Utilities Service. Introduced September 6, 2001; referred to Committees on Agriculture; Ways and Means; Energy and Commerce; and Education and the Workforce.

H.R. 3090 (Thomas, Bill)

Economic Security and Recover Act of 2001. Section 902 (added by Senate Finance Committee) provides a 10% tax credit for "current generation" broadband service (defined as download speeds of at least 1 million bits per second) for rural and low-income areas, and a 20% tax credit for "next generation" broadband service (defined as download speeds of at least 22 million bits per second). Introduced

October 11, 2001. Passed House October 24, 2001. Reported by Senate Finance Committee with an amendment in the nature of a substitute, November 9, 2001.

H.R. 4641 (Markey)

Wireless Technology Investment and Digital Dividends Act of 2002. Establishes a Broadband Infrastructure Investments Program, funded by a trust fund financed by revenues from spectrum auctions. Program would make grants to nonprofit organizations, States, or local governments for broadband deployment in underserved rural areas and low-income housing and community centers. Introduced May 2, 2002; referred to Committee on Energy and Commerce.

S. 88 (Rockefeller)

Broadband Internet Access Act of 2001. Provides tax credits for five years to companies investing in broadband equipment. Provides a 10% tax credit for “current generation” broadband service (defined as download speeds of at least 1.5 million bits per second) for rural and low-income areas, and a 20% tax credit for “next generation” broadband service (defined as download speeds of at least 22 million bits per second). Introduced January 22, 2001; referred to Committee on Finance.

S. 150 (Kerry)

Broadband Deployment Act of 2001. Provides tax credits for five years to companies investing in broadband equipment to serve low-income areas. Provides a 10% tax credit for broadband service delivering a minimum download speed of 1.5 million bits per second. Introduced January 23, 2001; referred to Committee on Finance.

S. 426 (Clinton)

Technology Bond Initiative of 2001. Provides an income tax credit to holders of bonds financing the deployment of broadband technologies. Introduced March 1, 2001; referred to Committee on Finance.

S. 428 (Clinton)

Broadband Expansion Grant Initiative of 2001. Authorizes \$100 million in grants and loan guarantees from the Department of Commerce for deployment by the private sector of broadband telecommunications networks and capabilities to underserved rural areas. Introduced March 1, 2001; referred to Committee on Commerce, Science, and Transportation.

S. 430 (Clinton)

Broadband Rural Research Investment Act of 2001. Authorizes \$25 million for the National Science Foundation to fund research on broadband services in rural and other remote areas. Introduced March 1, 2001; referred to Committee on Finance.

S. 966 (Dorgan)

Rural Broadband Enhancement Act. Gives new authority to the Rural Utilities Service in consultation with the National Telecommunications and Information Administration to make low interest loans to companies that are deploying broadband technology in rural areas. Introduced May 25, 2001; referred to Committee on Commerce, Science, and Transportation.

S. 1571 (Lugar)

Farm and Ranch Equity Act of 2001. Section 602 would authorize the Secretary of Agriculture to make loans and grants to entities providing broadband service to rural areas. Introduced October 18, 2001; referred to Committee on Agriculture, Nutrition, and Forestry.

S. 1731 (Harkin)

Agriculture, Conservation, and Rural Enhancement Act of 2001. Title VI (Section 605) would authorize the Secretary of Agriculture to make loans and grants to entities providing broadband service to rural areas. Introduced November 27, 2001; referred to Committee on Agriculture, Nutrition, and Forestry. Committee report (S.Rept. 107-117) filed December 7, 2001. Incorporated into H.R. 2646 as an amendment and passed by Senate, February 13, 2002. Conference report (H.Rept. 107-424) filed in House May 1, 2002.

S. 2448 (Hollings)

Broadband Telecommunications Act of 2002. Provides loans and grants to encourage broadband deployment in rural and underserved areas. Also provides grants to foster broadband demand and technology development. Introduced May 2, 2002; referred to Committee on Commerce, Science and Transportation.

S. 2582 (Lieberman)

National Broadband Strategy Act of 2002. Requires the President to submit a report to Congress setting forth a comprehensive strategy for the nationwide deployment of high speed broadband Internet telecommunications services. Introduced June 5, 2002; referred to Committee on Commerce, Science, and Transportation.

Policy Issues

As summarized above, legislation has been introduced into the 107th Congress that seeks to provide federal financial assistance for broadband deployment in underserved areas. In assessing this legislation, several policy issues arise.

Is Broadband Deployment Data Adequate? Obtaining an accurate snapshot of the status of broadband deployment is problematic. Anecdotes abound of rural and low-income areas which do not have adequate Internet access, as well as those which are receiving access to high-speed, state-of-the-art connections. Rapidly evolving technologies, the constant flux of the telecommunications industry, the uncertainty of consumer wants and needs, and the sheer diversity and size of the nation's economy and geography make the status of broadband deployment very difficult to characterize. The FCC has begun the process of periodically collecting deployment data from the private sector. In using these data as the basis of the Second Report, the FCC acknowledges that broadband deployment data collection and analysis remain a work in progress. According to FCC Commissioner Tristani, "[t]he data on which the Report relies suffer from several weaknesses that undermine

our ability to draw well-supported conclusions and to identify with specificity at-risk communities.”⁴³

The FCC is working to refine the data used in future Reports in order to provide an increasingly accurate portrayal. Meanwhile, other studies have been released or are forthcoming which could shed further light on broadband deployment. The General Accounting Office (GAO) released a report in October 2000 which examined how competition is developing in the market for Internet access services, including the development of consumer choice of Internet access.⁴⁴

Some argue that because the overall status of broadband deployment is not yet adequately understood, government intervention is not appropriate at this time. On the other hand, advocates of federal assistance for broadband deployment maintain that the available data indicate clearly enough that rural and low-income areas are being underserved, and that the risk of delaying assistance to these areas outweighs the benefit of waiting for more complete data.

Is Federal Assistance for Broadband Deployment Premature or Inappropriate? Related to the data issue is the argument that government intervention in the broadband marketplace would be premature or inappropriate. The FCC currently does not favor significant regulatory intervention, arguing that broadband deployment is in its early stages, that critical applications and attractive content for broadband have not yet emerged, and that even in areas where broadband access is available, it is not yet apparent that most consumers are willing to pay the average fee of \$50 per month for this new service. Some argue that financial assistance for broadband deployment could distort private sector investment decisions in a dynamic and rapidly evolving marketplace, and question whether federal tax dollars should support a technology that has not yet matured, and whose societal benefits have not yet been demonstrated.⁴⁵

On the other hand, proponents of financial assistance counter that the available data show, in general, that the private sector will invest in areas where it expects the greatest return – areas of high population density and income. Without some governmental assistance in underserved areas, they argue, it is reasonable to conclude that broadband deployment will lag behind in many rural and low income areas. Proponents of a more federal support for broadband deployment also argue that broadband is an important contributor to future economic growth. Because the

Also see: Thierer, Adam, *Broadband Tax Credits, the High-Tech Pork Barrel Begins*, Cato Institute, July 13, 2001, available at: [<http://www.cato.org/tech/tk/010713-tk.html>].

federal government has not adopted an aggressive broadband policy, they assert, the U.S. is lagging behind other countries in broadband deployment.⁴⁶

Which Approach is Best? If one assumes that governmental action is appropriate to spur broadband deployment in underserved areas, which specific approaches, either separately or in combination, would likely be most effective? Targeted grants and loans from several existing federal programs have been proposed, as well as tax credits for companies deploying broadband systems in rural and low-income areas. How might the impact of federal assistance compare with the effects of regulatory or deregulatory actions?⁴⁷ And finally, how might any federal assistance programs best compliment existing “digital divide” initiatives by the states, localities, and private sector?⁴⁸

⁴⁶ An OECD study found the U.S. ranking fourth in broadband subscribership per 100 inhabitants (after Korea, Sweden, and Canada). See: Organization for Economic Cooperation and Development, Directorate for Science, Technology and Industry, *The Development of Broadband Access in OECD Countries*, October 29, 2001, 63 pages. For a comparison of government broadband policies, also see: OECD, Directorate for Science, Technology and Industry, *Broadband Infrastructure Deployment: The Role of Government Assistance*, May 22, 2002, 42 pages. Available at: [<http://www.oecd.org>]

⁴⁷ See CRS Issue Brief IB10045 for a detailed discussion of these issues.
