Gasoline Prices: Policies and Proposals

SUMMARY

As Congress continues to consider major energy legislation, the high price of gasoline remains an issue to be considered. The legislative proposals of past Congresses have contained numerous provisions that would affect gasoline supply and demand, as does current legislation.

A large number of factors combined to put pressure on gasoline prices, including increased world demand for crude oil and U.S. refinery capacity inadequate to supply gasoline to a recovering national economy. The war and continued violence in Iraq added uncertainty and a threat of supply disruption that added pressure particularly to the commodity futures markets.

Numerous provisions in legislative proposals in the 108th Congress addressed perceived problems in the oil and gasoline markets. A comprehensive energy policy bill, H.R. 6, was reported out of conference and approved by the House, but several issues kept the bill from passing the Senate. Among the most controversial were provisions regarding the use of ethanol and the additive methyl tertiary butyl ether (MTBE) in motor fuel, proposals to open up part of the Arctic National Wildlife Refuge (ANWR) to oil and gas

development, measures concerning corporate average fuel economy (CAFE) standards, and proposals to aid construction of new refineries and to harmonize state “boutique fuels” standards.

In the 109th Congress, the House passed a comprehensive bill, again numbered H.R. 6, with many of the same provisions of the bill considered in the previous Congress. As before, MTBE and ANWR remained controversial. The new version added another controversial provision, giving the Federal Energy Regulatory Commission (FERC) overriding authority over state entities in licensing terminals to receive and process liquefied natural gas.

The gasoline price surge heightened discussion of energy policy, but the urgency of previous energy crises has been lacking. In part this may be due to the fact that there has been no physical shortage of gasoline, and no lines at the pump. In addition, the expectation of former crises, that prices were destined to grow ever higher, has not been prevalent. However, the persistence of high gasoline and oil prices into a second summer has raised alarms over the economic consequences of the situation.

MOST RECENT DEVELOPMENTS

Crude oil prices rose again to the mid-\$50 per barrel range in early March 2005, driven by projections of continued strong world demand and uncertainty about production policies and capabilities of the Organization of Petroleum Exporting Countries (OPEC). Gasoline followed suit later in the month, surging past \$2.00 per gallon, as it had twice before the previous year. The trend continued into April. On April 5 Federal Reserve Chairman Alan Greenspan warned that the oil “price frenzy” would have a negative effect on the economy.

On March 9, 2005, the Senate Budget Committee issued a budget resolution that assumes \$2.5 billion of revenue from leases in the Arctic National Wildlife Refuge (ANWR). On March 17 the Senate passed the budget resolution (S.Con.Res. 18) after voting 49-51 the previous day to reject an amendment by Senator Cantwell to remove the ANWR provision.

On April 21 the House passed H.R. 6, the Energy Policy Act of 2005, containing many of the provisions in the bill considered in the previous Congress (also numbered H.R. 6), including a “safe harbor” provision to protect producers of methyl tertiary butyl ether (MTBE) from product liability suits.

BACKGROUND AND ANALYSIS

The run-up of gasoline prices that began in spring 2004 (see **Figure 1**) climaxed a period of almost five years during which gasoline prices demonstrated a great deal of regional volatility but less of an increase at the national level. In 2004 a large number of factors combined to exert pressure on gasoline prices in all parts of the country. Some of these factors have affected the price of crude oil, and others the cost of producing and marketing gasoline.

Past energy crises have demonstrated that oil is traded in a world market, in which events in remote areas affect the price of crude for almost everyone. In the 12-18 months leading up to the crisis, these events included:

- Decisions by the Organization of Petroleum Exporting Countries (OPEC) cartel, after having reduced production quotas in 2002, to raise them only slowly and reluctantly;
- Unexpected demand growth in China;
- Disruptions in oil production in major exporters, including Venezuela, Iraq and Nigeria;
- Decline in the value of the U.S. dollar, the currency in which oil is traded in the world market, compared to other major currencies, particularly the Euro.
- Uncertainty and fear of major disruptions in Iraq and Saudi Arabia, in the context of the war in Iraq and the threat of terrorism.

As often happens when commodity prices are volatile, speculation in futures contracts accentuated the upward price pressure and appeared to continue high prices longer than

would be expected as market fundamentals push toward lower prices. Secretary of Energy Spencer Abraham, criticizing speculation in oil markets, asserted in July that the price of oil was \$10 per barrel too high because of the possibility of disruptions in supply.¹ Nevertheless, the price went even higher in August and again in October, and continued high into the new year.

Just as a number of factors led to increased crude prices, a combination of features in the U.S. refinery industry contributed to an increase in gasoline prices.

- U.S. demand for gasoline has increased as economic growth has resumed.
- Domestic refining capacity has declined, both in number of refineries — from 324 in 1981 to 153 in 2002 — and in total capacity — from 18.62 million barrels per day (mbd) in 1981 to 16.78 mbd in 2002.
- The structure of the refining industry has changed. In 1981 most refining capacity was owned and operated by integrated oil companies that supplied their own crude oil, refined it, distributed it, and marketed the products. Refining was only one part of the company's profit-making operation, and frequently was not an important profit maker. Now the refining industry is characterized more by independently owned, nonintegrated firms. When refineries are the sole source of revenue to the owners, it becomes more important that the operation be profitable, leading to pressure to raise prices.
- The refining industry has been operating with lower inventories of both crude oil and gasoline, as a means of cutting costs. The side effect has been reduced ability to meet unanticipated demand, leading to greater price pressure.
- Gasoline markets are fragmented regionally because air quality requirements have led to numerous different formulations to meet varying standards. In meeting demand for these regional formulations, called "boutique fuels," refiners lose flexibility to meet local variations in demand elsewhere, leading to increased price pressure.
- With domestic refining capacity constraints, a greater proportion of gasoline demand is being met with imported products. Foreign refiners typically manufacture products designed to sell in the international market, not the special product "boutique fuels" demanded by a significant share of the U.S. market.
- Refiners have had increased costs in the past year to comply with new requirements to limit sulfur content and to switch from the oxygenate additive MTBE to ethanol.

¹ "Abraham criticizes high cost of oil," *Washington Times*, July 7, 2004, p. A1.

These various factors pushed the nationwide average price of gasoline over \$2 per gallon in May 2004. By mid-June, Energy Information Administrator Guy Caruso was able to note a slight decline in prices, and tell a Senate Energy Committee hearing that, “absent major disruptions, oil and gasoline markets may be turning a corner.”² However, persistent high crude prices pushed gasoline prices over \$2 again in October, and yet again in March 2005. By April 2005, Caruso was suggesting that increasing world demand for oil might keep the price of crude above \$50 per barrel through 2006.³

The price surge intensified discussion of energy policy and led to further calls for passage of energy legislation. However, the urgency of previous energy crises has been lacking. In part this may be because, although the price of gasoline in nominal terms set a record, in real terms it was less than in the Iranian crisis years of the early 1980s. (See **Figure 2**.) Further, unlike the earlier crises, there was no physical shortage of gasoline, and no lines at the pump. In addition, as **Figure 3** indicates, the proportion of consumer expenditure on oil and gasoline had declined from the high levels of the 1970s and early 1980s. Perhaps most important, the common view during the earlier crises was that oil prices not only were high, but were destined to become ever higher in the coming years. This view is no longer prevalent, and the general expectation has been that the run-up of prices in 2004 is a temporary phenomenon.

Policy Options

The several energy crises of the past led to major legislative action, twice in the 1970s and once following the 1991 Gulf War. The current legislative situation differs from the previous actions because the Congress had been considering major energy legislation for three years before the situation became a nationwide concern. The various versions of a comprehensive energy bill, which failed to pass in the 108th Congress, all contained measures addressing some of the problems putting pressure on gasoline prices. In addition, a number of stand-alone legislative proposals to deal with some of the specific problems noted above were introduced in the 108th Congress. Most of these measures were included in the 109th Congress's energy bill, the Energy Policy Act of 2005, H.R. 6, which passed the House April 21, 2005.

As in previous legislative energy debates, a major policy divide exists between those who view the gasoline-fueled automobile as a temporary necessity to be tolerated only until a substitute fuel or alternative means of transportation can be developed, and those who expect oil to be the same dominant transportation fuel in the indefinite future that it is at present. Compromise agreements have been reached via a combination of measures that enhance the development of alternatives or restrain the growth in demand for oil, on the one hand, and those that increase production or reduce the cost of supplying that demand, on the other. However, individual measures often carry with them complicating features that make passage more difficult. In addition, major legislation often becomes the vehicle for measures that typically would not find enough support to pass as individual bills, or which may be added to gain support for the whole measure. In the legislative climate of the 108th Congress,

balancing the various interests involved proved too difficult a task, despite the influence of a nationwide energy crisis in an election year. Under the stimulation of continued high oil and gasoline prices, the 109th Congress is pursuing the goal again, with supporters of the legislation expressing more optimism that conflicts can be resolved.

Although major legislation did not pass in the 108th Congress, a number of the energy tax measures were included in two tax bills that became law, the Working Families Tax Relief Act (H.R. 1308, P.L. 108-311) and the American Jobs Creation Act (H.R. 4520, P.L. 108-357). However, in the 109th Congress H.R. 6 as passed by the House contains numerous tax measures, many of them affecting the oil industry.

Major Oil-Related Issues for the 109th Congress

A number of issues have been major barriers to passage of omnibus energy legislation, and remain to be resolved in the 109th Congress. Some of these issues do not involve oil; provisions to continue the restructuring of the electric power industry, for instance, have been and continue to be controversial. Among oil-related issues, proposals to open part of the Arctic National Wildlife Refuge (ANWR) to oil and gas development, and measures concerning Corporate Average Fuel Economy (CAFE) standards have stimulated major debate. But the primary stumbling block has been the issue involving ethanol as an automobile fuel, and the related problems involving the gasoline fuel additive MTBE.

Ethanol and MTBE. The roots of the controversy lie in the Clean Air Act Amendments of 1990, which mandated that “reformulated” gasoline required in some localities to improve air quality contain 2% oxygen. This requirement could be met by adding ethanol to gasoline, but it could also be achieved by adding a substance called methyl tertiary butyl ether (MTBE), which had been produced in small quantities for many years as an octane enhancer. Because MTBE was cheaper than ethanol and was easier to mix and transport than ethanol, many refiners began using it to meet the new standards.

However, as its use spread, it became apparent that MTBE tended to escape easily from pipes and storage tanks, and contaminate water supplies, imparting a taste and odor that was unpalatable even in small quantities. This development led to moves to restrict and prohibit the use of MTBE. It also led a number of communities to sue refiners for the cost of decontaminating their water supply. At the same time, evidence began to accumulate that oxygenating gasoline was not necessary to achieve the air quality benefits of reformulated gasoline.

The omnibus energy bills in the 108th Congress addressed this changing situation by repealing the oxygenation requirement in the Clean Air Act, but adding a new mandate that gasoline have an increasing amount of renewable fuel, presumably ethanol. Consumption of ethanol in gasoline in 2002 was 2.1 billion gallons. Under the Renewable Fuel Standard, the amount required to be consumed would be 3.1 billion gallons in 2005 and 5.0 billion gallons by 2012. This would still be a small proportion of the total amount of gasoline consumed, which was close to 150 billion gallons in 2004, but was expected to stimulate the ethanol industry and the agricultural sector that supplies it. It was opposed by oil industry interests, who complained of the mandated increase in consumption of ethanol, which receives a substantial tax credit. Some suggested that it would raise prices locally, despite the subsidy.

The most controversial measure in the bills was a so-called “safe harbor” provision from product liability lawsuits for producers of MTBE and renewable fuels. It was a major factor in the failure of comprehensive energy legislation in the Senate in the 108th Congress.

In the 109th Congress, H.R. 6, as reported by the House Committee on Energy and Commerce on April 13, 2005, retained the safe harbor provision; an amendment to remove it was defeated in committee. When the bill reached the House floor, Representative Capps brought up an amendment to strike the safe harbor language. After extended debate specifically on the MTBE provision, the Capps amendment was narrowly defeated by a vote of 213-219.

ANWR. Oil and gas exploration and development of part of the Arctic National Wildlife Refuge have been controversial for many years. This was part of the early proposals for legislation that eventually became the Energy Policy Act of 1992, but was dropped in the face of strong opposition in both houses. Support for action grew gradually through the decade, along with technological developments that advocates claimed would reduce the environmental impact of development, and the House included a development measure in its version of an omnibus energy bill in August 2001. A similar measure was part of the House-passed legislation in the 108th Congress. Opposition in the Senate kept the measure from the floor, however, and it was dropped in conference.

In the 109th Congress, Senate supporters of ANWR development have moved the issue to the budget process, where it can be approved by a simple majority vote. On March 9, 2005, the Senate Budget Committee issued a FY2006 budget resolution that assumes \$2.5 billion of revenue over five years from leases in ANWR. On March 16 the Senate rejected an amendment by Senator Cantwell to strike the ANWR provisions, by a vote of 49-51. The next day the Senate passed the budget resolution (S.Con.Res. 18).

The House FY2006 budget resolution (H.Con.Res. 95, passed March 17) does not contain the ANWR provision. However, the Energy Policy Act of 2005, H.R. 6, does authorize exploration and development of ANWR, and an amendment to strike the provision during floor debate was defeated, 200-231.

CAFE. Fuel economy standards also have a long history of controversy, going back to their establishment in the 1970s. Proposals to mandate new standards were also considered, but dropped, early in the development of the 1992 Energy Policy Act. In the mid-1990s the National Highway Traffic Safety Administration (NHTSA) was considering a rulemaking that would result in increased standards for light duty trucks (including sport utility vehicles), but for several years the Congress included in its annual appropriation for NHTSA a measure prohibiting NHTSA from analyzing or undertaking such a ruling. That prohibition was dropped in the FY2004 NHTSA appropriations, and a final rule issued by NHTSA in April 2003 requires a boost in light truck fuel economy to 22.2 miles per gallon by Model Year 2007.

Omnibus energy legislation proposed before NHTSA acted would have mandated specific increases in light truck fuel economy, but in the 109th Congress H.R. 6 would merely amend slightly the criteria NHTSA must follow in its rulemaking and authorize appropriations of \$2 million annually through FY2008 for that purpose. During floor debate on H.R. 6, an amendment to increase fuel economy standards to 33 miles per gallon over 10

years was defeated by a vote of 177-254. A more general amendment to require the Administration to take “voluntary, regulatory, and other actions” to reduce oil demand in the United States by 1 million barrels per day from projected levels by 2013 was defeated 166-262.

Other Oil and Gasoline Measures. Other provisions in H.R. 6 related to petroleum would authorize:

- The federal government to continue to receive physical quantities of oil and gas as royalty-in-kind payments instead of cash payments for royalties on leased federal property.
- Royalties for certain types of leases in the Gulf of Mexico, and others such as marginal wells to be lowered or terminated.
- Regulatory requirements to be eased for some oil and gas activities such as hydraulic fracturing and construction of exploration and production facilities.
- The system of leasing and permitting access to federal lands for oil and gas development to be amended.
- The amendment of statutes concerning alternative-fueled vehicles.
- Steps to discourage the proliferation of state “boutique fuels” requirements. Additionally, a study of “harmonization” of current fuel controls would be mandated.

In June 2004 in the last Congress, the House passed H.R. 4517, the U.S. Refinery Revitalization Act, which would have eased regulatory requirements for construction of new refineries in areas of high unemployment. In the 109th Congress, the provisions of the Refinery Revitalization Act were included in H.R. 6 as passed by the House April 21, 2005.

A new provision in H.R. 6 gives the Federal Energy Regulatory Commission (FERC) authority over siting and licensing of facilities to import and process liquefied natural gas (LNG). The statutory language would largely confirm FERC’s assumption of a lead role in siting LNG facilities, which has been challenged in court by several states. An amendment to strike the LNG provision was defeated on the House floor by a vote of 194-237.

LEGISLATION

109th Congress

S.Con.Res. 18. An original concurrent resolution setting forth the congressional budget for the U.S. government for FY2006 and including the appropriate budgetary levels for FY2005 and FY2007 through FY2010. Contains instructions to the Committee on Energy

and Natural Resources that assume revenues from the sale of ANWR leases. Passed Senate March 17, 2005.

H.R. 6 (Barton)

Energy Policy Act of 2005. Introduced April 18, 2005. Passed by the House April 21, 2005 (249-183).
