Analyst in Social Legislation
Domestic Social Policy Division

Summary

The Low-Income Home Energy Assistance Program (LIHEAP) is a block grant program under which the federal government gives annual grants to states, the District of Columbia, U.S. territories and commonwealths, and Indian tribal organizations to operate multi-component home energy assistance programs for needy households. This report reviews how allotments of regular LIHEAP funding are determined and how these calculations change at different funding levels. Included is a description of the components of the new LIHEAP formula rates. The data reflect new formula factors reported by the Department of Health and Human Services (HHS) in December 2005. These figures have been updated to reflect conversations with HHS on their allotment methodology. This report will be updated as events warrant.

Low-Income Home Energy Assistance Program

The Low-Income Home Energy Assistance Program (LIHEAP) is a block grant program under which the federal government gives annual grants to states, the District of Columbia, U.S. territories and commonwealths, and Indian tribal organizations to operate multi-component home energy assistance programs for needy households.¹ Established in 1981 by Title XXVI of P.L. 97-35, LIHEAP has been reauthorized and amended several times, most recently in 2005, when P.L. 109-58 reauthorized annual regular

¹ For additional information on LIHEAP, see CRS Report RL31865, *The Low-Income Home Energy Assistance Program (LIHEAP): Program and Funding Issues*, by Libby Perl and Emilie Stoltzfus.

LIHEAP funds at \$5.1 billion per year from FY2005 to FY2007. The LIHEAP appropriation for FY2005 was \$2.182 billion.

Federal standards have very broad guidelines, with almost all decisions regarding LIHEAP made by the states. Recipients may be helped with their regular heating and cooling costs, may receive crisis assistance, may have weatherization expenses paid, or may receive other aid designed to reduce their home energy needs. Because many households may receive more than one kind of LIHEAP assistance, a total, unduplicated number of households assisted is not available. However, these data are used to estimate that some 4.8 million households received heating assistance or heat-related crisis aid in FY2003.

Type of Grants Authorized Under LIHEAP

The LIHEAP statute provides for two types of program funding: regular and contingency grants. Regular funds are allotted to states according to methods prescribed by the LIHEAP statute as amended by the Human Services Reauthorization Act of 1984 (P.L. 98-558). The method of allotment may change based on the funding level. For FY2005 Congress made \$1.885 billion in regular LIHEAP grants available.

Emergency funds may be released and allotted to one or more states at the discretion of the President and the Secretary of Health and Human Services (HHS). The funds may be released at any point in the fiscal year to meet additional home energy assistance needs created by a natural disaster or other emergency.² In FY2005, Congress provided \$298 million in emergency funds for contingency purposes.

Current Law Distribution: How Allotments of Regular LIHEAP Funding Are Determined

Current law provides for three different methods to calculate each state's allotment of regular LIHEAP funds. The calculation method depends upon the size of the appropriation for that fiscal year. *For funding levels above \$1.975 billion, no method will allocate a state less funds than the state would have received at a \$1.975 billion funding level in FY1984. However, the proportion of total regular funds each state receives may differ substantially from the proportion that would have been received at \$1.975 billion.*

Tier I: Below \$1.975 Billion. Current law requires that for fiscal years in which the regular LIHEAP fund appropriation is \$1.975 billion or less, as has been the case each fiscal year since FY1987, states receive the same percentage of funds that were received in FY1984 (Section 2604(a)(2)(A)).³ The LIHEAP formula in FY1984 distributed funds by giving states the same share of funds that they received in FY1981 under the predecessor program to LIHEAP, the Low-Income Energy Assistance Program (LEAP).

² Depending on how Congress appropriates them, emergency funds may remain available for distribution in more than one fiscal year or they may expire with the fiscal year for which they were appropriated.

³ All section citations refer to the Low Income Home Energy Assistance Act (Title XXVI of P.L. 97-35), as amended.

Column (a) in **Table 1** reports the amount of funds that each state would have received in FY1984 had the regular appropriation been \$1.975 billion.

Tier II: From \$1.975 up to \$2.25 Billion. If the regular LIHEAP appropriation exceeds \$1.975 billion for the fiscal year (Section 2604(a)(2)(A)(ii)), *all* funds are to be distributed under a different methodology, including a new set of rates that are subject to a hold-harmless *level*. The set of factors used to determine this new set of rates is sometimes called the “new” formula. Under Tier II calculations, a state’s allotment in the statute is required to reflect “the percentage which expenditures for home energy by low-income households in that state bears to such expenditures in all states ...” (See “Components of the New Formula” below.) However, the statute provides that no state can be allocated *less* LIHEAP funds than the state would have received under the Tier I formula if the appropriation level in 1984 were equal to \$1.975 billion.⁴ This provision is known as the “hold-harmless” level.

Since this language was enacted, Congress further provided that HHS could use regular LIHEAP appropriations for Training and Technical Assistance (P.L. 99-425) as well as authorized both Leveraging Incentive Grants (P.L. 101-501) and the Residential Energy Assistance Challenge option (P.L. 103-252) — both are generally funded out of regular LIHEAP funds. These debits on the regular funds account were not in place for FY1984. Because they affect the level of regular funds available for state grant allotments by approximately \$25 million, it is possible that HHS would not implement the new formula before a regular funds appropriation level reaches \$2.0028 billion.

Implementing the hold-harmless level greatly changes the proportion of the total allocation that most states receive. This is because the statute provides that the hold-harmless levels must be achieved by reducing the allocation of funds to those states with the greatest proportional gains. Column (b) in **Table 1** reports the estimated allotment of funds that each state receives when the regular appropriation is at \$2.0 billion, the amount of regular LIHEAP funding reported in H.Rept. 109-300, whereas Column (c) reports the estimated allotment of funds when the regular appropriation is just under \$2.25 billion (\$2,249,999,999). The allocations in (c) are calculated using the Tier II methodology previously described.

Tier III: At or Above \$2.25 Billion. The law stipulates additional requirements in the methods for distributing funds when the appropriation is at or above \$2.25 billion (Section 2604(a)(2)(B)). At this level all of the provisions specified in the Tier II allocation methodology are in place, including the change in the formula factors and the hold-harmless level. In addition, a new hold-harmless *rate* is applied. For all appropriation levels at or above \$2.25 billion, states that would have received less than 1% of a total \$2.25 billion appropriation must be allocated the percentage they would have received at a \$2.14 billion appropriation level (assuming the new percentage is greater than the percentage originally calculated at the actual, \$2.25 billion or greater, appropriation). This hold-harmless *rate* ensures a state specific *share* of the total available funds. The allocations to the states with the greatest *proportional* funding share

⁴ In fact, the appropriation in 1984 was not \$1.975 billion but the law refers to this hypothetical amount in its hold-harmless provision. The actual FY1984 provision was \$2.075 billion.

increases are then ratably reduced again, using the methodology described in the Tier II discussion, until there is no funding shortfall.

The application of the hold-harmless *rate* creates another layer of discontinuity in the allocation rates. Column (c) in the table reports the estimated allotment of funds that each state receives when the regular appropriation is just under \$2.25 billion, whereas Column (d) reports the estimated allotment of funds that each state receives when the regular appropriation is at \$2.25 billion *after the hold-harmless rate* is applied. Column (e) reports the estimated allotment of funds that each state receives when the regular appropriation is at \$3.0 billion (H.Rept. 109-300 funding plus the House reconciliation bill, H.R. 4241, funding). Column (f) reports estimated allotment of funds that each state receives when the regular appropriation is at \$5.1 billion (the amount authorized by P.L. 109-58).

Components of the New Formula Rates (Used in Tiers II and III)

For funding levels above \$1.975 billion, statute provides that HHS is to “determine the expenditure for home energy by low-income households on the basis of the most recent satisfactory data available.” Developed by HHS, this formula accounts for variations in heating and cooling needs of the states, in types of energy used, variations in energy prices, and in the low-income population and their heating and cooling methods. Thus, the new formula rates⁵ are a complex aggregation of four major groups of state-level data.

- *Average Annual Heating and Cooling degree days by state.* A heating degree day measures the extent to which a day’s average temperature falls below 65°F and a cooling degree day measures the extent to which a day’s average temperature rises above 65°F. This information is collected by the National Oceanic and Atmospheric Administration. A state’s heating and cooling degree data are weighted by population in the state. Averages over 30 years also are measured and are taken into account by the formula.
- *Residential sector energy price projections by fuel type in nominal dollars.* These projected prices for fuels include fuel oil, natural gas, electricity, kerosene and liquefied petroleum gas. Regional variation of energy prices can be significant and the formula takes expected expenditure differences into account. This information is collected by the Department of Energy’s Energy Information Administration (EIA) and published in the State Energy Price and Expenditure Report.
- *Residential energy consumption by fuel source,* for heating and for cooling by BTUs. There is substantial variation by state and region on the distribution of types of energy used for home consumption. Fuel oil, natural gas, electricity, and kerosene consumption data are collected in the State Energy Data Report from the EIA. Data for coal, wood, and liquefied petroleum gas are collected in the Combined State Energy Data System by the EIA.

⁵ The formula factors were most recently updated in December 2005.

- The *number of heating and cooling units by fuel source and the number of low-income households by fuel source* are calculated from Census data by the Bureau of the Census, Department of Commerce. The ratio of low-income heating and cooling use by region and fuel source for all income levels of heating and cooling is calculated by using the Residential Energy Consumption Survey from EIA.

New Formula Issues: Appropriate and Timely Measures. Several questions may face Congress about the new formula calculation and Tiers II and III methodologies.

The determination of appropriate funding levels to trigger the use of the new formula. The new formula rate is applied at levels above \$1.975 billion. However, after all hold-harmless conditions are satisfied, not all states receive the proportion of funds equivalent to their new formula rate.

The determination of appropriate measures of home energy consumption. The incorporation of cooling days (defined as temperatures above 65°F) may overstate warmer states' energy needs and understate colder states' energy needs.

Timely calculation of the new rates. Even the most current information is often several years old by the time it is available. For example, the energy price data are from 2003. As a result, the raw data used in these calculations may not be applicable to current home energy needs.

Total	\$1,972.325	\$1,969.529	\$2,219.191	\$2,219.191	\$2,968.175	\$5,065.331

Source: Congressional Research Service (CRS) calculations based on factors provided by the Department of Health and Human Services (HHS) in December 2005.

Notes: These estimates take into account current program practice where HHS sets aside funds out of regular LIHEAP funds for technical assistance and training, territories, leverage incentive grants and Residential Energy Assistance Challenge (REACH) grants. This has implications for the total amount of funds going directly to the states. For example, \$2.0 billion appropriation is estimated to result in \$1.970 billion in regular LIHEAP funds going directly to the states. Because \$1.970 billion is less than the hypothetical \$1.972 billion that would have gone to the states under the hypothetical FY1984 appropriation, CRS estimates that the funds from an appropriation of \$2.0 billion would be distributed under the Tier I formula.
