Energy: Useful Facts and Numbers

Summary

Energy supplies and prices are a major economic factor in the United States, and energy markets are volatile and unpredictable. For both these reasons, energy policy is of frequent interest to the Congress. This report presents a statistical view of the supply and consumption of various forms of energy.

After an introductory overview of aggregate energy consumption, the report presents detailed analysis of trends and statistics regarding specific energy sources: oil, electricity, natural gas, and coal. A section on trends in energy efficiency is also presented.

This report depends largely on data released annually by the Energy Information Administration (EIA) and will be updated as new data become available.

Energy: Useful Facts and Numbers

Introduction

Tracking changes in energy activity is complicated by variations in different energy markets, most of which operate independently. Since aggregate indicators of total energy production and consumption do not adequately reflect these complexities, this compendium focuses on the details of individual activities. Primary among these are oil, particularly gasoline for transportation, and electricity generation and consumption. Natural gas is also an important energy source, for home heating as well as in industry and electricity generation. Coal is used almost entirely for electricity generation, nuclear and hydropower completely so.

Solar power and other renewable sources (except hydropower) continue to offer more potential than actual energy production. Conservation and energy efficiency have shown significant gains over the past three decades, however, and offer encouraging potential to relieve some of the dependence on imports that has caused economic difficulties in the past as well as the present.

To give a general view of energy consumption trends, **Table 1** shows consumption by economic sector — residential, commercial, transportation, and industry — from 1950 to the present. To supplement this overview, some of the trends are highlighted by graphs in **Figures 1 and 2**.

In viewing these figures, a note on units of energy may be helpful. Each source has its own unit of energy. Oil, for instance, is measured in million barrels per day (mbd), coal in million tons per year, natural gas in trillion cubic feet (TCF) per year. To aggregate various types of energy in a single table, a common measure, British Thermal Unit (Btu) is often used. In **Table 1**, energy consumption by sector is given in units of quadrillion Btus per year, or “quads,” while per capita consumption is given in million Btus (MBtu) per year. One quad corresponds to one TCF of natural gas, or approximately 50 million tons of coal. One million barrels per day of oil is approximately 2 quads per year. Approximately 3,600 kilowatt-hours (kwh) of electricity is equivalent to one MBtu.

From **Table 1** it can be seen that total U.S. energy consumption almost tripled in the half-century from 1950 to 2000, with the industrial sector, the heaviest energy user, growing at the slowest rate. When population increase is accounted for, the growth in energy consumption during the period was about 50%. As **Figure 1** illustrates, much of the growth in per capita energy consumption took place before 1970.

Table 1 does not include consumption of energy by the electricity sector, because it is both a producer and a consumer of energy. For the residential, commercial, industrial and transportation sectors, the consumption figures given are

the sum of the resources such as oil and gas that are directly consumed, plus the total energy used to produce the electricity each sector consumed. As **Figure 2** demonstrates, a major trend during the 50-year period was the electrification of the residential and commercial sectors, and also of industry to a lesser extent. By the beginning of the new century, electricity represented 65% of residential energy consumption, 75% of commercial energy consumption, and about a third of industrial energy consumption.

Consumption of major energy resources — petroleum, natural gas, and coal — is presented in **Table 2**, and shown graphically in **Figure 3**. The historical trends show that petroleum has been and continues to be the major source of energy, rising from about 38% in 1950 to 45% in 1975, then declining to about 40% in response to the energy crisis of the 1970s. Natural gas followed a similar pattern at a lower level, increasing its share of total energy from about 17% in 1950 to over 30% in 1970, then declining to about 20%. Coal, still a major energy source in 1950 at 35%, declined to about 20% a decade later and has remained at about that level since then.

Table 2. Energy Consumption in Quads and Percent of Total, 1950-2004

	Petroleum		Natural Gas		Coal		Other		Total

Oil

Almost 40% of the energy consumed in the United States is supplied by petroleum, and that proportion has remained approximately the same since 1950, as the data in the previous section show. Also unchanged is the almost total dependence of the transportation sector on petroleum, mostly gasoline.

The perception that the world is on the verge of running out of oil, widespread during the 1970s, has changed, however. The rapid price increases at that time, aided by improved exploration and production technology, stimulated a global search for oil and resulted in the discovery of large amounts of new reserves. Indeed, as concerns about tightening supply and continually increasing prices were at a peak, proven reserves actually increased by about 50% between 1973 and 1990. Some of the increase was in the Western Hemisphere, mostly in Mexico, but most was located in the region that already dominated the world oil market, the Middle East. With prices essentially steady during the 1990s, the search for oil slowed, but additions to reserves during the decade exceeded the amount of oil pumped out of the ground. By 2003 improved technology for retrieving petroleum from oil sands in Canada, and to a lesser extent heavy oil in Venezuela, led to the addition to proven world reserves of approximately 200 billion barrels, or 20% of the total 1991 figure. These trends are illustrated in **Figure 4**.

Petroleum Consumption, Supply and Imports

Consumption of petroleum by sector reflects a variety of trends. In the residential and commercial sectors petroleum consumption grew steadily from 1950 to 1970, while accounting for about 15% of total petroleum consumption. After the price surge in the 1970s, consumption in those sectors declined, falling to less than 7% of total petroleum consumption. Usage in the electric power sector followed a similar but more abrupt pattern. Until 1970 only about 3% of petroleum went to power generation. In the late 1960s efforts to improve air quality by reducing emissions led utilities to convert a number of coal-fired powerplants to burn oil, and many new plants were designed to burn oil or natural gas. Utilities found themselves committed to increasing dependence on oil just at the time of shortages and high prices; in 1975 almost 9% of oil consumption went for power production. Consumption then fell sharply as alternate sources became available, declining to about 2%-3% of total consumption.

Industrial consumption of petroleum, which includes such large consumers as refineries and petrochemical industries, has remained about 25% of total consumption throughout the last half-century. As other sectors' share fell, transportation, which was a little more than half of total consumption prior to 1975, climbed to almost two-thirds by 2000.

Table 4. U.S. Petroleum Production, 1950-2004
(million barrels per day)

	Crude Oil			Gas Liquids	Other*	Total
	48 States	Alaska	Total			
1950	5.4	—	5.4	0.5	—	5.9

* Includes processing gain

While petroleum consumption increased throughout the last half century (except for a temporary decline following the price surge of the 1970s), U.S. domestic production peaked in 1970 (see **Table 4**). The result, as shown in **Figure 5**, was greater dependence on imported petroleum, which rose from less than 20% in 1960 to more than 50% in 2003.

Figure 5. U.S. Dependence on Imported Petroleum, 1960-2003

Petroleum and Transportation

Since the transportation sector is so heavily dependent on petroleum, and uses so much of it, **Table 5** presents a more detailed breakdown of the various types of petroleum used.

Aviation fuel includes both aviation gasoline and kerosene jet fuel. In 1950 aviation was almost entirely gasoline powered; by 2000 it was 99% jet fueled. The growth in flying is illustrated by the fact that aviation fuel was only 3% of petroleum consumption for transportation in 1950, but had grown to 12% in 1965 and has maintained that share since then.

Diesel fuel consumption showed a similar dramatic increase. About 6% of total petroleum consumption for transportation in 1950, it rose to 11% by 1975 and to 20% by 2003. Diesel fuel is used by a number of transportation sectors. Part of the increase involved the change of railroads from coal-fired steam to diesel and diesel-electric power. Diesel fuel is used also in the marine transportation sector, and some private automobiles are diesel-powered. The major part of diesel fuel consumption in transportation is by large commercial trucks. Total diesel fuel consumption increased from about 200,000 barrels per day in 1950 to 2.6 million barrels per day in 2003.

Most of the petroleum consumed in the transportation sector is motor gasoline. In 1950 it was 71% of total sector consumption, and by 2003, despite the increase in aviation fuel and diesel, it was 67%. In that half century, gasoline consumption increased by a factor of 3.5. Most motor gasoline is consumed by private vehicles, although commercial small trucks and some large ones are significant users.

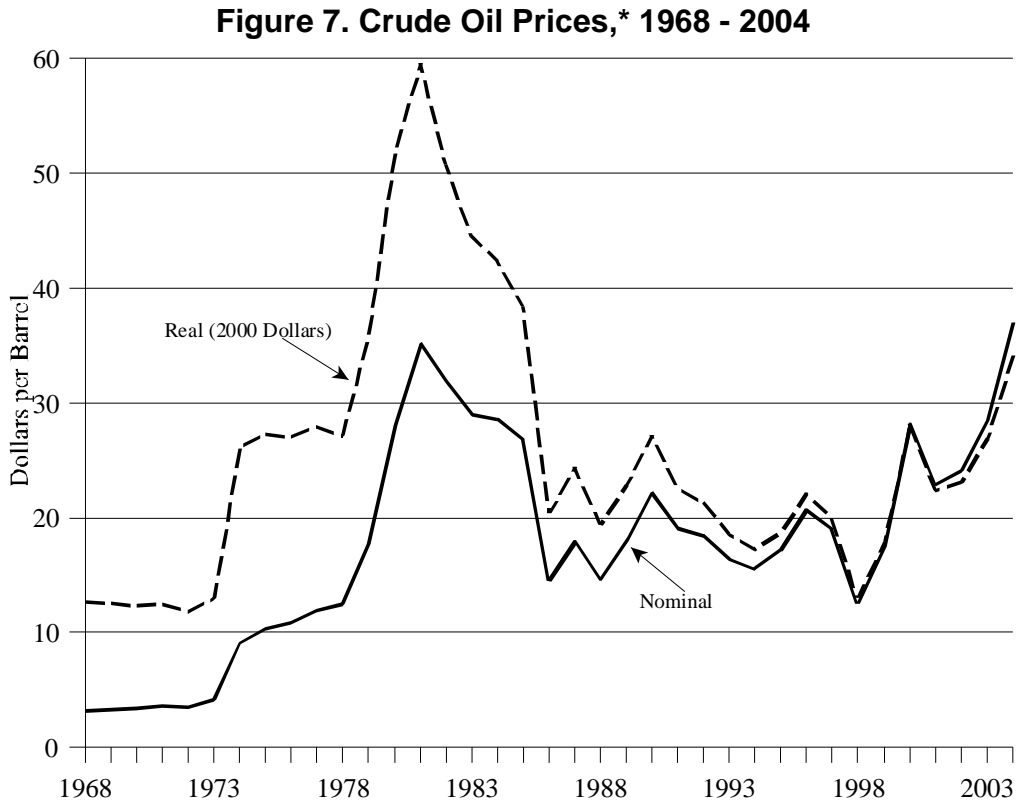

Of the other petroleum products consumed in the transportation sector, the largest is residual fuel oil, most of which is used in large marine transport. Consumption of residual fuel oil in the transportation sector was about 500,000 barrels in 1950, and declined gradually to about 400,000 in 2000.

Source: EIA, *Annual Energy Review 2004*, Table 5.12c.

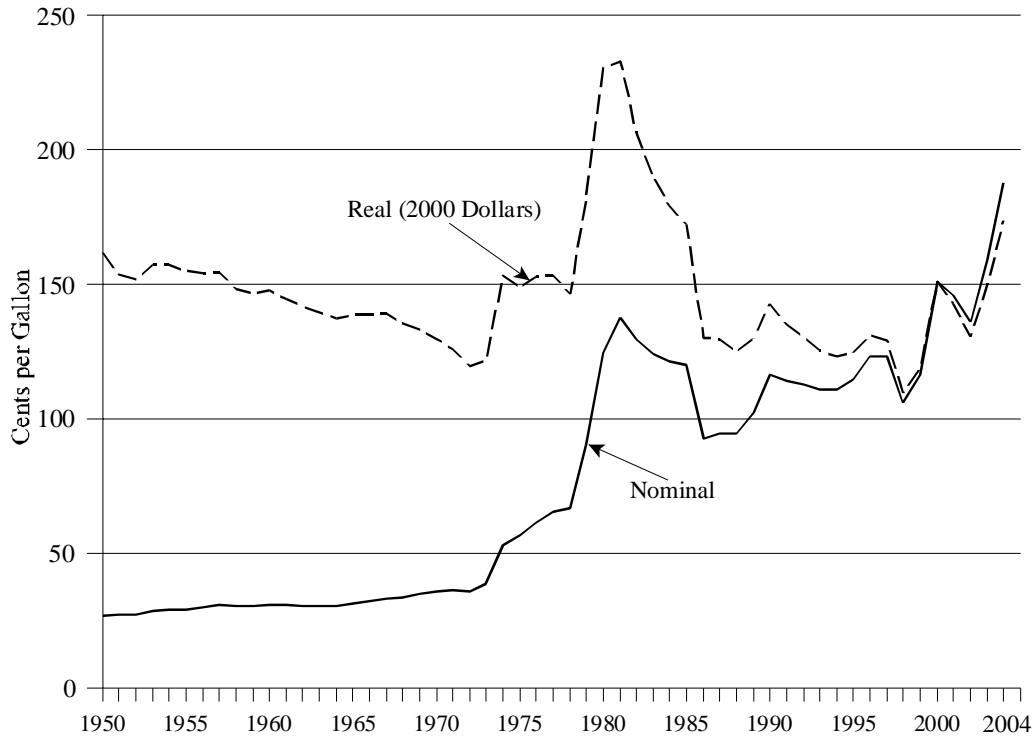

Petroleum Prices: Historical Trends

Most commodity prices are typically volatile. Because oil is widely consumed, and is so important at all levels of the economy, its price is closely watched and analyzed. Especially since the 1970s, when a generally stable market dominated by a few large oil companies was broken by the Organization of Petroleum Exporting Countries (OPEC) cartel and a relatively open world market came into being, the price of crude oil has been particularly volatile, as illustrated in **Figure 7**.

* composite crude oil refiner acquisition cost

Figure 8. Price per Gallon of Motor Gasoline, 1950 - 2004

Source: EIA, *Annual Energy Review 2004*, Table 5.24.

At the consumer level, prices of products such as motor gasoline and heating oil have reacted to price and supply disruptions in ways that have been modulated by various government and industry policies and international events. A significant and not often noted fact is that, like many commodities, the long-term trend in gasoline prices, adjusted for inflation and excluding temporary surges, has been down. As shown in **Figure 8**, the real price of gasoline peaked in 1980, then fell precipitously in the mid-1980s. The surge in prices in the summer of 2004 (not shown in the graph) brought the price close to the peak of 1980. (For more current data on gasoline price trends, see CRS Issue Brief IB10134, *Gasoline Prices: Policies and Proposals*, by Carl Behrens.)

Figure 9. Consumer Spending on Oil as Percentage of GDP, 1970-2000

Source: EIA, *Annual Energy Review*, 2004, Table 3.4.

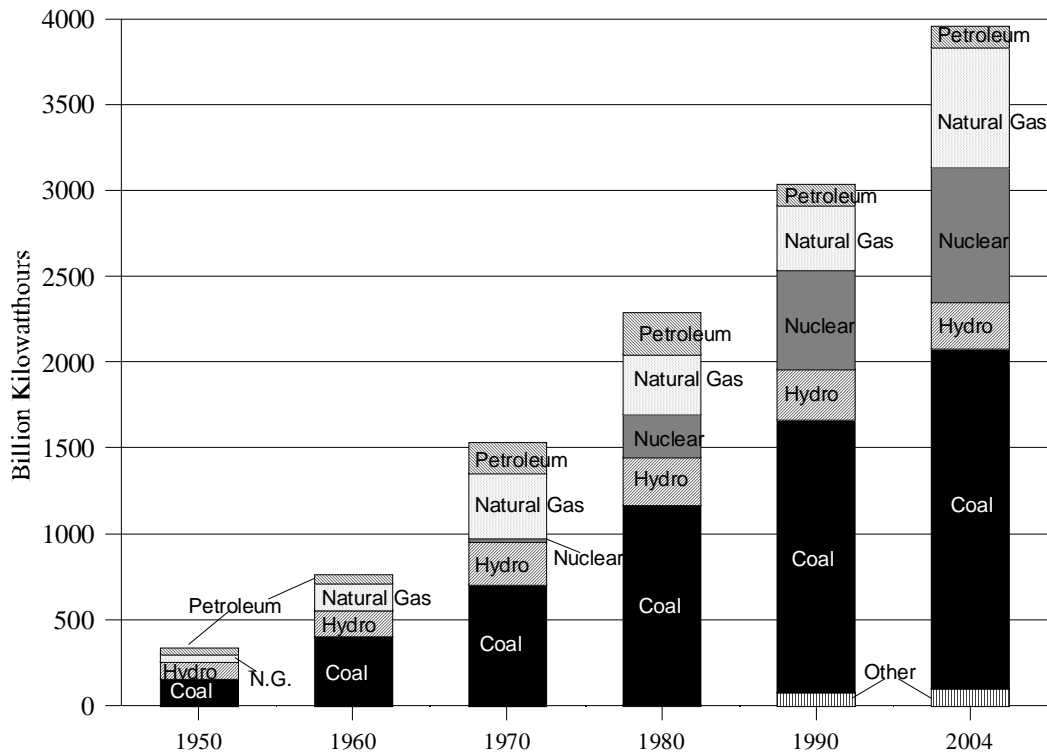

The effect of this trend is shown in **Figure 9**, which illustrates the proportion of the gross domestic product (GDP) dedicated to consumer spending on oil. The price surges in the 1970s pushed this ratio from about 4.5% before the Arab oil embargo to about 8.5% following the 1978 crisis in Iran, but since then it has declined to less than 4%.

Gasoline Taxes. The federal tax on gasoline is currently 18.4 cents per gallon. An extensive list of the gasoline and diesel fuel tax rates imposed by each state per gallon of motor fuel is maintained and updated by the American Petroleum Institute (API), "State Motor Fuel Excise Tax Rates," at [<http://api-ec.api.org/filelibrary/mft010106.pdf>]

Electricity

While overall energy consumption in the United States increased nearly three-fold since 1950, electricity consumption increased even more rapidly. Annual power generation is ten times what it was in 1950. **Figure 10** illustrates the trend.

Figure 10. Electricity Generation by Source, selected years 1950 - 2004

Source: EIA, *Annual Energy Review 2004*, Table 8.2a.

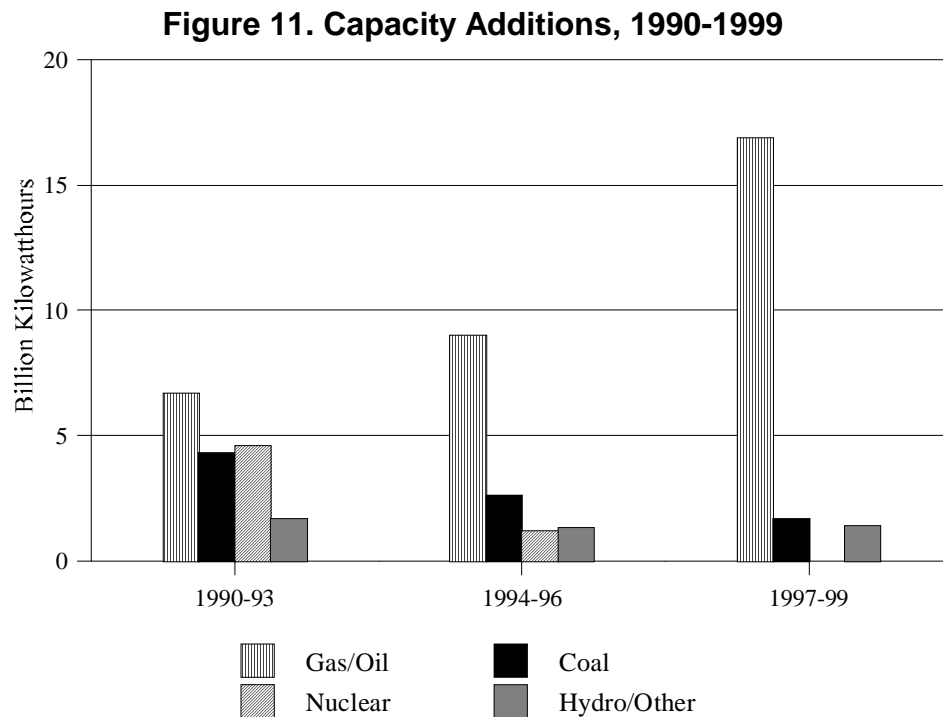

Throughout this period, coal was used to generate about half the rapidly increasing amount of electricity consumed. Petroleum became briefly important as a source of power generation in the late 1960s because it resulted in lower emissions of air pollutants, but the price surges of the 1970s reversed that trend, and in 2003 only 3% of power generation was oil-fired.

Natural gas generation has a more complicated history. Consumption by the electric power industry increased gradually as access by pipeline became more widespread. With the price surge in oil in the 1970s, demand for gas also increased, but interstate prices were regulated, and gas availability declined. In addition, federal energy policy viewed generation of electricity by gas to be a wasteful use of a diminishing resource. The Fuel Use Act of 1978 prohibited new power generators from using gas and set a timetable for shutting down existing gas-fired plants. Gas prices were later deregulated, resulting in increased production, and the Fuel Use Act was repealed, but in the meantime generation of electricity from gas fell from 24% in 1970 to 12% in 1985. In the 1990s gas became more popular, and by 2000 was supplying 16% of total electric generation. Most capacity additions during the late

1990s were gas fired, as illustrated in **Figure 11**. The increased demand contributed to high prices in 2000 that were felt particularly in California.

Nuclear power started coming on line in significant amounts in the late 1960s, and by 1975, in the midst of the oil crisis, was supplying 9% of total generation. However, increases in capital costs, construction delays, and public opposition to nuclear power following the Three Mile Island accident in 1979 curtailed expansion of the technology, and many construction projects were cancelled. Continuation of some construction increased the nuclear share of generation to 20% in 1990, where it remains currently, but no new plants are currently under construction or on order.

Construction of major hydroelectric projects has also essentially ceased, and hydropower's share of electricity generation has gradually declined from 30% in 1950 to 15% in 1975 and less than 10% in 2000. However, hydropower remains highly important on a regional basis.

Source: EIA, *Electric Power Monthly*, October 2005, Tables 1.6B, 1.7B, 1.8B, 1.9B, 1.11B, and 1.12B.

Note: "Other" includes renewables other than hydro, pumped storage, petroleum coke, gases other than natural gas, and other sources.

Sources of power generation vary greatly by region (see **Table 6**). Hydropower in the Pacific Coast states, for instance, supplies over 40% of total generation, and natural gas almost 35%. In 2000, the combination of a drought-caused shortage of hydropower, a tightening of gas supply, and California's new electric regulatory scheme and market manipulation caused very sharp increases in electricity prices in that region. Other regions are heavily dependent on coal generation: the north central and east south central states, as well as the mountain states, generate more than 60% of their electricity from coal, while other regions such as New England and the Pacific Coast use relatively little coal. The west south central region generates 43% of its electricity from gas. New England in the 1970s and 1980s was heavily dependent on oil-generated power; in 2003, despite an increased use of natural gas, oil produced 9% of New England's power, compared to the national average of 2.5%.

Figure 12. Price of Retail Residential Electricity, 1960-2004

Source: EIA, *Annual Energy Review 2004*, Table 8.10.

Other Conventional Energy Resources

Natural Gas

Consumption of natural gas was about four times as great in 2004 as it was in 1950. Throughout the period, consumption in the residential and commercial sector grew at about the same rate as total consumption, in the range of 30% to 40% of the total. Consumption for electric power generation increased from about 10% in 1950 to more than 20% at the end of the century.

In part because of increased demand by electric utilities, natural gas prices have become extremely volatile in recent years, as illustrated by **Figure 13**.

Table 7. Natural Gas Consumption by Sector, 1950-2004

	Total Consumption (tcf)	Percent Consumed by:		
		Residential- Commercial	Industrial	Electric
1950	5.77	27.5	59.4	10.9
1955	8.69	31.7	52.2	13.3
1960	11.97	34.5	48.2	14.4
1965	15.28	35.0	46.5	15.2
1970	21.14	34.2	43.8	18.6
1975	19.54	38.0	42.8	16.2
1980	19.88	37.0	41.2	18.5
1985	17.28	39.7	39.7	17.6
1990	19.17	36.6	43.1	16.9
1995	22.21	35.5	42.3	19.1
2000	23.33	35.0	39.8	22.3
2001	22.24	35.0	38.1	24.0
2002	23.01	34.9	37.5	24.6
2003	22.38	37.1	36.9	22.9
2004	22.32	35.3	37.7	24.0

Coal

Consumption of coal about doubled in the half-century from 1950 to 2000, but during that period coal as an energy source changed from a widely used resource to a single-use fuel for generating electricity. In 1950 the residential and commercial sector consumed almost a quarter of total coal consumed; by 1980 less than 1% of coal went to that sector. In transportation, steam locomotives (and some coal-fired marine transportation) consumed 13% of coal; by 1970 they were all replaced by diesel-burning or electric engines. Industry consumed 46% of coal in 1950; by 2000 less than 10% of coal was consumed by that sector. Meanwhile, the electric power sector, which consumed less than 20% of the half-billion tons of coal burned in 1950, used more than 90% of the billion-plus tons consumed in 2004.

Table 8. Coal Consumption by Sector, 1950-2004

	Total Consumption (Million Tons)	Percent Consumed by:			
		Residential- Commercial	Industrial	Transportation	Electric
1950	494.1	23.2	45.5	12.8	18.6
1955	447.0	15.3	48.7	3.8	32.2
1960	398.1	10.3	44.6	0.8	44.4
1965	472.0	5.4	42.6	0.1	51.9
1970	523.2	3.1	35.7	0.1	61.2
1975	562.6	1.7	26.2	—	72.2
1980	702.7	0.9	18.1	—	81.0
1985	818.0	1.0	14.2	—	84.8
1990	904.5	0.7	12.7	—	86.5
1995	962.1	0.6	11.0	—	88.4
2000	1084.1	0.4	8.7	—	90.9
2003	1094.1	0.4	7.8	—	91.8
2004	1104.3	0.4	7.7	—	91.9

Conservation and Energy Efficiency

Vehicle Fuel Economy

Energy efficiency has been a popular goal of policy makers in responding to the repeated energy crises of recent decades, and efforts to reduce the energy intensity of a broad spectrum of economic activities have been made both at the government and private level. Because of the transportation sector's near total dependence on vulnerable oil supplies, improving the efficiency of motor vehicles has been of particular interest. (For an analysis of legislative policies to improve vehicle fuel economy, see CRS Issue Brief IB90122, *Automobile and Light Truck Fuel Economy: The CAFE Standards*, by Robert Bamberger.) **Figure 14** illustrates the trends in this effort for passenger cars and for light trucks, vans, and sport utility vehicles, as well as the general lack of improvement in heavy trucks.

Source: EIA, *Monthly Energy Review*, October 2005, Table 1.9.

Further analysis by the Environmental Protection Agency (EPA), involving the composition of the fleet as well as the per-vehicle fuel rates, indicates that light vehicle fuel economy has declined on average between 1988 and 2003. This is largely because of increased weight, higher performance, and a higher proportion of sport utility vehicles and light trucks sold. In 2003, SUVs, pickups and vans comprised 48% of all sales, more than twice their market share in 1983. (The EPA study is available online at [<http://www.epa.gov/otaq/fetrends.htm>].)

Energy Consumption and GDP

A frequent point of concern in formulating energy policy is the relationship between economic growth and energy use. It seems obvious that greater economic activity would bring with it increased energy consumption, although many other factors affecting consumption make the short-term relationship highly variable. Over a longer period, for some energy-related activities, the relationship with economic growth has been essentially level. For the period from 1973 to 2003, for instance, consumption of electricity remained close to 0.45 kwh per constant dollar of GDP. Similarly, the number of miles driven by all vehicles was close to 3 miles per constant dollar of GDP throughout the same period.

In the case of oil and gas, however, a remarkable drop took place in the ratio of consumption to economic growth following the price spikes and supply disruptions, as illustrated in **Figure 15**. Consumption of oil and gas declined from 14,000 Btus per constant dollar of GDP in 1973 to a little more than 8,000 in 1985, and has continued to decline at a slower rate since then.

Figure 15. Oil and Natural Gas Consumption per Dollar of GDP, 1973-2004

Source: EIA, *Monthly Energy Review*, October 2005, Table 1.8.

During the earlier period, oil and gas consumption actually declined 15% while GDP, despite many economic problems with inflation and slow growth, was increasing by 44% (see **Figure 16**). During the period 1987 to 2004, oil and gas consumption increased by about 26%, while GDP increased 66%.

Figure 16. Change in Oil and Natural Gas Consumption and Growth in GDP, 1973-2004

Major Statistical Resources

Links to Sources

Most of the tables and figures in this report are derived from data bases maintained by the Department of Energy's Energy Information Administration (EIA). If other or more detailed information is desired, the agency's website presents the complete text of its many statistical reports in PDF format, and also as spreadsheet files in the format of the program Excel. Some of the more important EIA publications are described below. Other sources used in this report are also listed.

Energy Information Administration. [<http://www.eia.doe.gov>]

"The agency's responsibility is to provide timely, high-quality information and to perform objective, credible analyses. ... EIA collects, evaluates, assembles, analyzes, and disseminates data and information relevant to energy resources, reserves, production, demand, technology, and related economic and statistical information."

Annual Energy Review [<http://www.eia.doe.gov/aer/contents.html>]

"The *Annual Energy Review (AER)* presents the Energy Information Administration's historical energy statistics. For many series, statistics are given for every year from 1949 through 2001. The statistics cover all major energy activities, including consumption, production, trade, stocks [inventories], and prices, for all major energy commodities, including fossil fuels, electricity, and renewable energy sources."

Monthly Energy Review [<http://www.eia.doe.gov/mer/contents.html>]

The *Monthly Energy Review (MER)* presents an overview of the EIA's recent monthly energy statistics. The statistics cover the major activities of U.S. production, consumption, trade, stocks (inventories) and prices for petroleum, natural gas, coal electricity, and nuclear energy.

International Energy Annual [<http://www.eia.doe.gov/iea/contents.html>]

The *International Energy Annual* presents information and trends on world energy production and consumption for petroleum, natural gas, coal, and electricity. This report is published to keep the public and other interested parties fully informed of primary energy supplies on a global basis.

Weekly Petroleum Status Report

[http://www.eia.doe.gov/oil_gas/petroleum/data_publications/weekly_petroleum_status_report/wpsr.html] The *Weekly Petroleum Status Report (WPSR)* provides data on supply and selected prices of crude oil and principal petroleum products in the context of historical data and forecasts. Updated every Wednesday morning.

Electric Power Annual

[http://www.eia.doe.gov/cneaf/electricity/epa/epa_sum.html]

The *Electric Power Annual* provides a statistical review of the domestic electric power industry for the most recent year including information on; industry capability, generation, fossil-fuel consumption, and stocks. Data on retail sales of electricity and average revenue per kilowatt-hour are also presented.

Other Sources.

Nuclear Regulatory Commission Information Digest

[<http://www.nrc.gov/reading-rm/doc-collections/nuregs/staff/sr1350/>]

Updated annually, this official NRC publication (NUREG-1350) includes general statistics on U.S. and worldwide nuclear power production, U.S. nuclear reactors, and radioactive waste.

American Petroleum Institute (API)

[<http://api-ec.api.org/newsplashpage/index.cfm>]

The primary trade association of the oil and natural gas industry representing more than 400 members. Research, programs, and publications on public policy, technical standards, industry statistics, and regulations. Includes the “State Motor Fuel Excise Tax Rates” mentioned above. [<http://api-ec.api.org/filelibrary/mft010106.pdf>]

Bloomberg.Com, Market Data: Commodities, Energy Prices

[<http://www.bloomberg.com/energy/index.html>]

Displays four tables:

- *Petroleum (\$/bbl)* for crude oil. The generally accepted price for crude oil is “WTI Cushing \$” which is listed fourth in the table.
- *Petroleum (¢/gal)* for heating oil and gasoline.
- *Natural Gas (\$/MMBtu)*
- *Electricity (\$/megawatt hour)*

This site is updated two to three times per day.

AAA’s Daily Fuel Gauge Report [<http://www.fuelgaugereport.com/index.asp>]

At-the-pump retail fuel prices for gasoline and diesel fuel. Gives average price for today, yesterday, a month ago and a year ago for wholesale and crude oil. Also displays line chart showing the averages for the previous 12 months. National, state, and metropolitan data.

International Energy Agency [<http://www.iea.org>]

The International Energy Agency is an autonomous body within the Organization for Economic Co-operation and Development (OECD). It gathers and analyzes statistics and “disseminates information on the world energy market and seeks to promote stable international trade in energy.”

A subscription is required to access most of the information on this Website, although a limited amount of information is available to nonsubscribers. Members of Congress and their staff should contact CRS for a copy of anything that requires a subscription.
