Patent Reform in the 110th Congress: Innovation Issues

Summary

Congressional interest in patent policy and possible patent reform has expanded as the importance of intellectual property to innovation has increased. Patent ownership is perceived as an incentive to the technological advancement that leads to economic growth. However, growing interest in patents has been accompanied by persistent concerns about the fairness and effectiveness of the current system. Several recent studies, including those by the National Academy of Sciences and the Federal Trade Commission, have recommended patent reform to address perceived deficiencies in the operation of the patent regime. Other experts maintain that major alterations in existing law are unnecessary and that the patent process can adapt, and is adapting, to technological progress.

Pending patent reform proposals would work significant legal changes to the patent system. Among the more notable of these proposed changes is a shift to a first-inventor-to-file priority system; substantive and procedural modifications to the patent law doctrine of willful infringement; and adoption of post-grant review proceedings, prior user rights, and pre-issuance publication of all pending applications. Several of these proposals have been the subject of discussion within the patent community for many years, but others are more novel propositions.

Current legislative reform efforts (H.R. 1908, S. 1145) also would address several issues of concern, including the quality of issued patents, the expense and complexity of patent litigation, harmonization of U.S. patent law with the laws of our leading trading partners, potential abuses committed by patent speculators, and the special needs of individual inventors, universities, and small firms with respect to the patent system. In addition, although the existing patent statute in large measure applies the same basic rules to different sorts of inventions, regardless of the technological field of that invention, the patent system is widely believed to impact different industries in varying ways.

The provisions of the proposed legislation would arguably work the most sweeping reforms to the U.S. patent system since the nineteenth century. However, many of these proposals, such as pre-issuance publication and prior user rights, have already been implemented in U.S. law to a more limited extent. These and other reforms, such as the first-inventor-to-file priority system and post-grant review proceedings, also reflect the decades-old patent practices of Europe, Japan, and our other leading trading partners.

Other observers are nonetheless concerned that certain of these proposals would weaken the patent right, thereby diminishing incentives for innovation. Some also believe that changes of this magnitude, occurring at the same time, do not present the most prudent course for the patent system. Patent reform therefore confronts Congress with difficult legal, practical, and policy issues, but also with apparent possibilities for altering and possibly improving the legal regime that has long been recognized as an engine of innovation within the U.S. economy.

Patent Reform in the 110th Congress: Innovation Issues

Introduction

Congressional interest in patent reform has increased as the patent system becomes more significant to U.S. industry.¹ There is broad agreement that more patents are sought and enforced than ever before; that the attention paid to patents in business transactions and corporate boardrooms has dramatically increased; and that the commercial and social significance of patent grants, licenses, judgments, and settlements is at an all-time high.² As the United States becomes even more of a high-technology, knowledge-based economy, the importance of patents may grow even further in the future.

Increasing interest in patents has been accompanied by persistent concerns about the fairness and effectiveness of the current system. Several recent studies, including those by the National Academy of Sciences and the Federal Trade Commission, have recommended legal reform to address perceived deficiencies in the operation of the patent regime.³ Other experts maintain that major alterations in existing law are unnecessary and that the patent process can adapt, and is adapting, to technological progress.

Two bills have been introduced before both houses of the 110th Congress that attempt to respond to current concerns about the functioning of the patent process. Both H.R. 1908 and S. 1145 propose significant legal reforms to the patent system. Among these reforms are a shift to a first-inventor-to-file priority system; substantive and procedural modifications to the doctrine of willful infringement; and adoption of assignee filing, post-grant review proceedings, prior user rights, and pre-issuance publication of all pending applications. Several of these proposals have been the

¹ This report is based substantially on CRS Report RL32996, *Patent Reform: Innovation Issues*, by John R. Thomas and Wendy H. Schacht. That report addressed patent reform issues in the 109th Congress.

² Statistics from the United States Patent and Trademark Office (USPTO) support this account. In 1980, the USPTO received 104,329 utility patent applications; by 2005, this number had grown to 390,733 applications. The number of U.S. patents granted in 1980 was 61,819; in 2006 this number had increased to 173,771. U.S. Patent and Trademark Office, *U.S. Patent Statistics, Calendar Years 1963-2006*. Available at [<http://www.uspto.gov>].

³ National Research Council, National Academy of Sciences, *A Patent System for the 21st Century*, [Washington, National Academies Press, 2004] and Federal Trade Commission, *To Promote Innovation: The Proper Balance of Competition and Patent Law and Policy*, October 2003, available at [<http://www.ftc.gov>].

subject of discussion within the patent community for many years, but others present more novel propositions. H.R. 1908 passed the House of Representatives on September 7, 2007, while S. 1145 was reported out of the Senate Committee on the Judiciary on July 19, 2007.

This study provides an overview of current patent reform issues. It begins by offering a summary of the structure of the current patent system and the role of patents in innovation policy. The report then reviews some of the broader issues and concerns, including patent quality, the high costs of patent litigation, international harmonization, and speculation in patents, that have motivated these diverse legislative reform proposals. The specific components of this legislation are then identified and reviewed in greater detail.

Patents and Innovation Policy

The Mechanics of the Patent System

The patent system is grounded in Article I, Section 8, Clause 8 of the U.S. Constitution, which states that “The Congress Shall Have Power ... To promote the Progress of Science and useful Arts, by securing for limited Times to Authors and Inventors the exclusive Right to their respective Writings and Discoveries” As mandated by the Patent Act of 1952,⁴ U.S. patent rights do not arise automatically. Inventors must prepare and submit applications to the U.S. Patent and Trademark Office (USPTO) if they wish to obtain patent protection.⁵ USPTO officials known as examiners then assess whether the application merits the award of a patent.⁶ The patent acquisition process is commonly known as “prosecution.”⁷

In deciding whether to approve a patent application, a USPTO examiner will consider whether the submitted application fully discloses and distinctly claims the invention.⁸ In addition, the application must disclose the “best mode,” or preferred way, that the applicant knows to practice the invention.⁹ The examiner will also determine whether the invention itself fulfills certain substantive standards set by the patent statute. To be patentable, an invention must be useful, novel and nonobvious. The requirement of usefulness, or utility, is satisfied if the invention is operable and provides a tangible benefit.¹⁰ To be judged novel, the invention must not be fully anticipated by a prior patent, publication or other state-of-the-art knowledge that is

⁹ *Ibid.*

¹⁰ 35 U.S.C. § 101.

collectively termed the “prior art.”¹¹ A nonobvious invention must not have been readily within the ordinary skills of a competent artisan at the time the invention was made.¹²

If the USPTO allows the patent to issue, the patent proprietor obtains the right to exclude others from making, using, selling, offering to sell or importing into the United States the patented invention.¹³ Those who engage in these acts without the permission of the patentee during the term of the patent can be held liable for infringement. Adjudicated infringers may be enjoined from further infringing acts.¹⁴ The patent statute also provides for the award of damages “adequate to compensate for the infringement, but in no event less than a reasonable royalty for the use made of the invention by the infringer.”¹⁵

The maximum term of patent protection is ordinarily set at 20 years from the date the application is filed.¹⁶ At the end of that period, others may employ that invention without regard to the expired patent.

Patent rights are not self-enforcing. Patentees who wish to compel others to observe their rights must commence enforcement proceedings, which most commonly consist of litigation in the federal courts. Although issued patents enjoy a presumption of validity, accused infringers may assert that a patent is invalid or unenforceable on a number of grounds.¹⁷ The U.S. Court of Appeals for the Federal Circuit (Federal Circuit) possesses national jurisdiction over most patent appeals from the district courts.¹⁸ The U.S. Supreme Court enjoys discretionary authority to review cases decided by the Federal Circuit.¹⁹

Innovation Policy

Patent ownership is perceived to be an incentive to innovation, the basis for the technological advancement that contributes to economic growth. It is through the commercialization and use of new products and processes that productivity gains are made and the scope and quality of goods and services are expanded. Award of a

¹⁹ 28 U.S.C. § 1254(1).

patent is intended to stimulate the investment necessary to develop an idea and bring it to the marketplace embodied in a product or process. Patent title provides the recipient with a limited-time monopoly over the use of his discovery in exchange for the public dissemination of information contained in the patent application. This is intended to permit the inventor to receive a return on the expenditure of resources leading to the discovery but does not guarantee that the patent will generate commercial benefits. The requirement for publication of the patent is expected to stimulate additional innovation and other creative means to meet similar and expanded demands in the marketplace.

Innovation produces new knowledge. One characteristic of this knowledge is that it is a “public good,” a good that is not consumed when it is used. This “public good” concept underlies the U.S. patent system. Absent a patent system, “free riders” could easily duplicate and exploit the inventions of others. Further, because they incurred no cost to develop and perfect the technology involved, copyists could undersell the original inventor. The resulting inability of inventors to capitalize on their inventions would lead to an environment where too few inventions are made.²⁰ The patent system corrects this market failure problem by providing innovators with an exclusive interest in their inventions for a period of time, thereby allowing them to capture the innovation’s marketplace value.

The regime of patents purportedly serves other goals as well. The patent system encourages the disclosure of products and processes, for each issued patent must include a description sufficient to enable skilled artisans to practice the patented invention.²¹ At the close of the patent’s 20-year term,²² others may practice the claimed invention without regard to the expired patent. In this manner the patent system ultimately contributes to the growth of the public domain.

Even during their term, issued patents may also encourage others to “invent around” the patentee’s proprietary interest. A patentee may point the way to new products, markets, economies of production and even entire industries. Others can build upon the disclosure of a patent instrument to produce their own technologies that fall outside the exclusive rights associated with the patent.²³

The patent system has also been identified as a facilitator of markets. Absent patent rights, an inventor may have scant tangible assets to sell or license. In addition, an inventor might otherwise be unable to police the conduct of a contracting party. Any technology or know-how that has been disclosed to a prospective licensee might be appropriated without compensation to the inventor. The availability of patent protection decreases the ability of contracting parties to engage in

²⁰ See Rebecca S. Eisenberg, “Patents and the Progress of Science: Exclusive Rights and Experimental Use,” 56 *University of Chicago Law Review* 1017 (1989).

²¹ 35 U.S.C. § 112.

²² 35 U.S.C. § 154.

²³ Eisenberg, *supra*, at 1017.

opportunistic behavior. By lowering such transaction costs, the patent system may make technology-based transactions more feasible.²⁴

Through these mechanisms, the patent system can act in more socially desirable ways than its chief legal alternative, trade secret protection. Trade secrecy guards against the improper appropriation of valuable, commercially useful and secret information. In contrast to patenting, trade secret protection does not result in the disclosure of publicly valuable information. That is because an enterprise must take reasonable measures to keep secret the information for which trade secret protection is sought. Taking the steps necessary to maintain secrecy, such as implementing physical security measures, also imposes costs that may ultimately be unproductive for society.²⁵

The patent system has long been subject to criticism, however. Some observers have asserted that the patent system is unnecessary due to market forces that already suffice to create an optimal level of innovation. The desire to obtain a lead time advantage over competitors, as well as the recognition that technologically backward firms lose out to their rivals, may well provide sufficient inducement to invent without the need for further incentives.²⁶ Other commentators believe that the patent system encourages industry concentration and presents a barrier to entry in some markets.²⁷ Still other observers believe that the patent system too frequently attracts speculators who prefer to acquire and enforce patents rather than engage in socially productive activity.²⁸

When analyzing the validity of these competing views, it is important to note the lack of rigorous analytical methods available for studying the effect of the patent law upon the U.S. economy as a whole. The relationship between innovation and patent rights remains poorly understood. As a result, current economic and policy tools do not allow us to calibrate the patent system precisely in order to produce an optimal level of investment in innovation. Thus, each of the arguments for and against the patent system remains open to challenge by those who are unpersuaded by their internal logic.

Current Issues and Concerns

Pending legislation — H.R. 1908 and S. 1145, both styled as the Patent Reform Act of 2007 — proposes a number of changes to diverse aspects of the patent system.

²⁴ Robert P. Merges, “Intellectual Property and the Costs of Commercial Exchange: A Review Essay,” 93 *Michigan Law Review* (1995), 1570.

²⁷ See John R. Thomas, “Collusion and Collective Action in the Patent System: A Proposal for Patent Bounties,” *University of Illinois Law Review* (2001), 305.

²⁸ *Ibid.*

Although these reforms were undoubtedly motivated by a range of concerns, a discrete number of issues have been the subject of persistent discussion in the patent community over a period of many years. Among these issues are concern for the quality of issued patents, the expense and complexity of patent litigation, harmonization of U.S. patent law with the laws of our leading trading partners, potential abuses committed by patent speculators, and the special needs of individual inventors, universities, and small firms with respect to the patent system. In addition, although the patent statute in large measure applies the same basic rules to different sorts of inventions, regardless of the technological field of that invention, the patent system is widely believed to impact different industries in varying ways.²⁹ As a result, different industries can be expected to espouse dissimilar views of certain patent reform proposals. Before turning to a more specific analysis of individual legislative proposals, this report reviews the proposed legislation's broader themes with regard to these issues and concerns.

Patent Quality

Government, industry, academia and the patent bar alike have long insisted that the USPTO approve only those patent applications that describe and claim a patentable advance.³⁰ Because they meet all the requirements imposed by the patent laws, quality patents may be dependably enforced in court and employed as a technology transfer tool. Such patents are said to confirm private rights by making their proprietary uses, and therefore their value, more predictable. Quality patents also may clarify the extent that others may approach the protected invention without infringing. These traits in turn should strengthen the incentives of private actors to engage in value-maximizing activities such as innovation or commercial transactions.³¹

In contrast, poor patent quality is said to hold deleterious consequences. Large numbers of inappropriately granted patents may negatively impact entrepreneurs. For example, innovative firms may be approached by an individual with a low quality patent that appears to cover the product they are marketing. The innovative firm may recognize that the cost of challenging a patent even of dubious validity may be considerable. Therefore, the firm may choose to make payments under licensing arrangements, or perhaps decide not to market its product at all, rather than contest the patent proprietor's claims.³²

²⁹ See Dan L. Burk & Mark A. Lemley, "Is Patent Law Technology-Specific?," 17 *Berkeley Technology Law Journal* (2002), 1155.

³⁰ CRS Report RL31281, *Patent Quality and Public Policy: Issues for Innovative Firms in Domestic Markets*, by John R. Thomas.

³¹ See Joseph Farrell & Robert P. Merges, "Incentives to Challenge and Defend Patents: Why Litigation Won't Reliably Fix Patent Office Errors and Why Administrative Patent Review Might Help," 19 *Berkeley Technology Law Journal* (2004), 943.

³² See Bronwyn H. Hall & Dietmar Harhoff, "Post-Grant Reviews in the U.S. Patent System — Design Choices and Expected Impact," 19 *Berkeley Technology Law Journal* (2004), 989.

Poor patent quality may also encourage opportunistic behavior. Perhaps attracted by large damages awards and a potentially porous USPTO, rent-seeking entrepreneurs may be attracted to form speculative patent acquisition and enforcement ventures. Industry participants may also be forced to expend considerable sums on patent acquisition and enforcement.³³ The net results would be reduced rates of innovation, decreased patent-based transactions, and higher prices for goods and services.

Although low patent quality appears to affect both investors and competitors of a patentee, patent proprietors themselves may also be negatively impacted. Patent owners may make managerial decisions, such as whether to build production facilities or sell a product, based upon their expectation of exclusive rights in a particular invention. If their patent is declared invalid by the USPTO or a court, patentees will be stripped of exclusive rights without compensation. The issuance of large numbers of invalid patents would increase the possibility that the investment-backed expectations of patentees would be disappointed.³⁴

The notion that high patent quality is socially desirable has been challenged, however. Some commentators believe that market forces will efficiently assign patent rights no matter what their quality. Others observe that few issued patents are the subject of litigation and further estimate that only a minority of patents are licensed or sold. Because many patented inventions are not used in a way that calls their validity into question, some observers maintain, society may be better off making a detailed review into the patentability of an invention only in those few cases where that invention is of commercial significance.³⁵

Pending legislation bears upon the patent quality issue. Both the House and Senate bills (H.R. 1908 and S. 1145) would allow for increased public participation in USPTO decisionmaking through a pre-issuance submission procedure. These bills also allow for post-issuance review proceedings, which would potentially allow interested parties to “weed out” invalid patents before they are the subject of licensing or infringement litigation.

Litigation Costs

Patent enforcement is often expensive. The complex legal and technological issues, extensive discovery proceedings, expert witnesses, and specially qualified attorneys associated with patent trials can lead to high costs.³⁶ One study published

³³ See Robert P. Merges, “As Many As Six Impossible Patents Before Breakfast: Property Rights for Business Concepts and Patent System Reform,” 14 *Berkeley Technology Law Journal* (1999), 577.

³⁴ See Craig Allen Nard, “Certainty, Fence Building and the Useful Arts,” 74 *Indiana Law Journal* (1999), 759.

³⁵ Mark A. Lemley, “Rational Ignorance at the Patent Office,” 95 *Northwestern University Law Review* (2001), 1495.

³⁶ Steven J. Elleman, “Problems in Patent Litigation: Mandatory Mediation May Provide (continued...) ”

in 2000 concluded that the average cost of patent enforcement was \$1.2 million.³⁷ These expenses appear to be increasing, with one more recent commentator describing an “industry rule of thumb” whereby “any patent infringement lawsuit will easily cost \$1.5 million in legal fees alone to defend.”³⁸ Higher stakes litigation is even more costly: for patent suits involving damages claims of more than \$25 million, expenses reportedly increase to \$4 million per side.³⁹

For innovative firms that are not infrequently charged with patent infringement, or that bring claims of patent infringement themselves, the annual expenses associated with patent litigation can be very dear. The Microsoft Corporation reportedly defends an average of 35 to 40 patent lawsuits annually at a cost of almost \$100 million.⁴⁰ The Intel Corporation has recently been estimated to spend \$20 million a year on patent litigation.⁴¹

The high costs of litigation may discourage patent proprietors from bringing meritorious claims against infringers. They may also encourage firms to license patents of dubious merit rather than contest them in court. Pending legislation would endeavor to make patent litigation less costly and complex through modification of the doctrine of willful infringement. H.R. 1908 and S. 1145 would also allow for an interlocutory appeal of claim construction rulings by the district courts. In addition, these bills call for an administrative post-grant review proceeding that could serve as a less expensive alternative to litigation.

International Harmonization

In the increasingly globalized, high-technology economy, patent protection in a single jurisdiction is often ineffective to protect the interests of inventors. As a result, U.S. inventors commonly seek patent protection abroad. Doing so can be a costly, time-consuming, and difficult process. There is no global patent system. Inventors who desire intellectual property protection in a particular country must therefore take specific steps to procure a patent within that jurisdiction.⁴²

Differences in national laws are among the difficulties faced by U.S. inventors seeking patent rights overseas. Although the world’s patent laws have undergone

considerable harmonization in recent years, several notable distinctions between U.S. patent law and those of our leading trading partners persist. H.R. 1908 and S. 1145 would address some of these differences by modifying U.S. patent law in order to comply with international standards. Among these proposed reforms are adoption of a first-inventor-to-file priority system, a post-grant review system, assignee filing, and prior user rights.

Potential Abuses of Patent Speculators

Some commentators believe that the patent system too frequently attracts speculators who prefer to acquire and enforce patents rather than engage in research, development, manufacturing, or other socially productive activity.⁴³ Patent speculators are sometimes termed “trolls,” after creatures from folklore that would emerge from under a bridge in order to waylay travelers.⁴⁴ The late Jerome C. Lemelson, a prolific inventor who owned hundreds of patents and launched numerous charges of patent infringement, has sometimes been mentioned in this context. The total revenue of the Lemelson estate’s patent licensing program has been reported as in excess of \$1.5 billion.⁴⁵ But as explained by journalist Michael Ravnitsky, “critics charge that many Lemelson patents are so-called submarine patents, overly broad applications that took so long to issue or were so general in nature that their owners could unfairly claim broad infringement across entire industry sectors.”⁴⁶ Of such patent ventures, patent attorney James Pooley observes:

Of course there is nothing inherently wrong with charging someone rent to use your property, including intellectual property like patents. But it’s useful to keep in mind — especially when listening to prattle about losing American jobs to foreign competition — that these patent mills produce no products. Their only output is paper, of a highly threatening sort.⁴⁷

Patent enforcement suits brought by patent speculators appear to present special concerns for manufacturers and service providers. If one manufacturer or service provider commences litigation against another, the defendant can often assert its own claims of patent infringement against the plaintiff. Because patent speculators do not otherwise participate in the marketplace, however, the defendant is unable to counter with its own patent infringement charges. This asymmetry in litigation positions

⁴³ See Elizabeth D. Ferrill, “Patent Investment Trusts: Let’s Build a Pit to Catch the Patent Trolls,” 6 *North Carolina Journal of Law and Technology* (2005), 367.

⁴⁴ See Lorraine Woellert, “A Patent War Is Breaking Out on the Hill,” *BusinessWeek* 45 (July 4, 2005).

⁴⁵ Nicholas Varchaver, “The Patent King,” *Fortune* (May 14, 2001), 202.

⁴⁶ Michael Ravnitsky, “More Lemelson Suits,” *The National Law Journal* (December 17, 2001), B9.

reportedly reduces the bargaining power of manufacturers and service providers, potentially exposing them to harassment.⁴⁸

Observers hasten to note, however, that not every patent proprietor who does not commercialize the patented invention should properly be considered an opportunistic “troll.” A nonmanufacturing patentee may lack the expertise or resources to produce a patented product, prefer to commit itself to further innovation, or otherwise have legitimate reasons for its behavior.⁴⁹ Universities and small biotechnology companies often fit into this category. Further, whether classified as a “troll” or not, each patent owner has presumptively fulfilled all of the relevant statutory requirements. Among these obligations is a thorough disclosure of a novel, nonobvious invention to the public.⁵⁰

The legislation introduced in the 110th Congress would impact concerns over “trolling” by the introduction of post-grant review procedures, universal pre-grant publication of applications, as well as reform of patent damages law.

The Role of Individuals, Universities and Small Entities

Entrepreneurs and small, innovative firms play a role in the technological advancement and economic growth of the United States.⁵¹ Several studies commissioned by U.S. federal agencies have concluded that individuals and small entities constitute a significant source of innovative products and services.⁵² Studies have also indicated that entrepreneurs and small, innovative firms rely more heavily upon the patent system than larger enterprises. Larger companies are said to possess alternative means for achieving a proprietary or property-like interest in a particular technology. For example, trade secrecy, ready access to markets, trademark rights, speed of development, and consumer goodwill may to some degree act as substitutes

See also CRS Report RL30216, *Small, High Tech Companies and Their Role in the Economy: Issues in the Reauthorization of the Small Business Innovation (SBIR) Program*, by Wendy H. Schacht.

⁵² For example, the National Academy of Engineering concluded that “small high-tech companies play a critical and diverse role in creating new products and services, in developing new industries, and in driving technological change and growth in the U.S. economy.” National Academy of Engineering, *Risk & Innovation: The Role and Importance of Small High-Tech Companies in the U.S. Economy* (Washington: National Academy Press, 1995), 37. This assessment was founded on the ability of small firms to develop markets rapidly, generate new goods and services, and offer diverse products. The study also concluded that small businesses were less risk adverse than larger, established corporations and were often better positioned to exploit market opportunities quickly.

to the patent system.⁵³ However, individual inventors and small firms often do not have these mechanisms at their disposal. As a result, the patent system may enjoy heightened importance with respect to these enterprises.⁵⁴

In recent years, universities have also become more full-fledged participants in the patent system. This trend has been attributed to the Bayh-Dole Act,⁵⁵ a federal statute that allowed universities and other government contractors to retain patent title to inventions developed with the benefit of federal funding.⁵⁶ In recent years there has reportedly “been a dramatic increase in academic institutions’ investments in technology licensing activities.”⁵⁷ This increase has been reflected in the growth in the number of patents held by universities, the number of universities with technology transfer offices, and the amount of patent-based licensing revenues that these offices have raised.⁵⁸

The U.S. patent system has long acknowledged the role, and particular needs, of independent inventors, small firms, and universities. For example, the patent statute calls for each of these entities to receive a 50% discount on many USPTO fees.⁵⁹ As the USPTO is currently entirely funded by the fees it charges its users,⁶⁰ this provision effectively calls for larger institutions to subsidize the patent expenditures of their smaller competitors.

Beyond potentially diminished financial resources vis-a-vis larger concerns, however, observers have disagreed over whether independent inventors, small firms, and universities have particular needs with respect to the patent system, and if so whether those needs should be reflected in patent law doctrines. With respect to the proposed system of “prior user rights,”⁶¹ for example, some observers state that such rights would particularly benefit small entities, which may often lack a sophisticated

⁶¹ Under a rule of “prior user rights,” when a conflict exists between an issued patent and an earlier user of the patented technology, the validity of the patent is upheld but the prior user is exempted from infringement. See Pierre Jean Hubert, “The Prior User Right of H.R. 400: A Careful Balancing of Competing Interests,” 14 *Santa Clara Computer and High Technology Law Journal* (1998), 189. Prior user rights are discussed further in this report below.

knowledge of the patent system.⁶² Others disagree, stating that smaller concerns rely heavily on the exclusivity of the patent right, and that the adoption of prior user rights would advantage large enterprises.⁶³ Similar debates have occurred with respect to other patent reform proposals, perhaps reflecting the fact that the community of independent inventors, small firms, and universities is itself a diverse one.

Pending legislation includes a number of provisions that appear to be of particular interest to independent inventors, universities, and small businesses, including a shift to a first-inventor-to-file priority system, prior user rights, and post-grant review procedures.

Different Roles for Patents in Distinct Industries

To a large extent, the patent statute subjects all inventions to the same standards, regardless of the field in which those inventions arose. Whether the invention is an automobile engine, semiconductor, or a pharmaceutical, it is for the most part subject to the same patentability requirements, scope of rights, and term of protection. Both experience and economic research suggest that distinct industries encounter the patent system in different ways, however.⁶⁴ As a result, it can be expected that particular industries will react differently to the various patent reform proposals currently before Congress.⁶⁵

Although broad generalizations should be drawn with care, two industries widely perceived as viewing the patent system in different ways are the pharmaceutical and software sectors. Within the pharmaceutical industry, individual patents are perceived as critical to a business model that provides life-saving and life-enhancing medical innovations, but eventually allows members of the public access to medicines at low cost. In particular, often only a handful, and sometimes only one or two patents cover a particular drug product. Patents are also judged to be crucial to the pharmaceutical sector because of the relative ease of replicating the finished

⁶² See Gary L. Griswold & F. Andrew Ubel, “Prior User Rights — A Necessary Part of a First-to-File System,” 26 *John Marshall Law Review* (1993), 567.

⁶³ See David H. Hollander, Jr., “The First Inventor Defense: A Limited Prior User Right Finds Its Way Into U.S. Patent Law,” 30 *American Intellectual Property Law Association Quarterly Journal* (2002), 37 (noting the perception that prior user rights favor large, well-financed corporations).

⁶⁴ In particular, economic research suggests that different industries attach widely varying values to patents. For example, one study of the aircraft and semiconductor industries suggested that lead time and the strength of the learning curve were superior to patents in capturing the value of investments. In contrast, members of the drug and chemical industries attached a higher value to patents. See Peter S. Menell, “A Method for Reforming the Patent System,” 13 *Michigan Telecommunications & Technology Law Review* (2007), 487; Richard C. Levin, Alvin K. Klevorick, Richard R. Nelson, and Sidney G. Winter, “Appropriating the Returns for Industrial Research and Development,” Brookings Papers on Economic Activity, 1987, in *The Economics of Technical Change*, eds. Edwin Mansfield and Elizabeth Mansfield (Vermont, Edward Elgar Publishing Co., 1993), 254.

⁶⁵ For additional discussion on this issue see CRS Report RL33367, *Patent Reform: Issues in the Biomedical and Software Industries*, by Wendy H. Schacht.

product. For example, while it is expensive, complicated, and time consuming to duplicate an airplane, it is relatively simple to perform a chemical analysis of a pill and reproduce it.⁶⁶

In contrast to the pharmaceutical field, the nature of software development is such that innovations are typically cumulative and new products often embody numerous patentable inventions. This environment has led to what has been described as a

poor match between patents and products in the [software] industry: it is difficult to patent an entire product in the software industry because any particular product is likely to include dozens if not hundreds of separate technological ideas.⁶⁷

This situation may be augmented by the multiplicity of patents often associated with a finished computer product that utilizes the software. It is not uncommon for thousands of different patents (relating to hardware and software) to be embodied in one single computer. In addition, ownership of these patents may well be fractured among hundreds or thousands of different individuals and firms.

In summary, then, the patent laws provide a “one size fits all” system, where all inventions are subject to the same requirements of patentability and scope of protection, regardless of the technical field in which they arose. Innovators in different fields nonetheless have varying experiences with the patent system. These discrepancies, among others, lead to the expectation that distinct industries may react differently to the various patent reform proposals presently considered by Congress.

Proposed Legislative Initiatives

Legislation has been introduced in both houses of Congress that proposes significant reforms to the patent system. With respect to the House of Representatives, H.R. 1908, titled the Patent Reform Act of 2007, was introduced on April 17, 2007, and passed the House on September 7, 2007. S. 1145, also titled the Patent Reform Act of 2007, was introduced in the Senate on April 17, 2007. S. 1145 was reported out of the Senate Committee on the Judiciary on July 19, 2007. Although the bills were identically worded upon their introduction, they have since been subject to amendments in committee that have sometimes differed in substance. For purposes of comparison, the following chart identifies the significant proposals of H.R. 1908 (as passed by the House) and S. 1145 (as reported from the Committee on the Judiciary). Please note that the two bills at times propose different reforms with respect to the same issue, including post-grant review proceedings, prior user rights, USPTO rulemaking authority, and venue.

First Inventor to File

S. 1145 would shift the U.S. patent priority rule from the current “first-to-invent” principle to the “first-inventor-to-file” principle.⁶⁸ H.R. 1908 would also shift to the “first-inventor-to-file” principle,⁶⁹ provided that “the President transmits to the Congress a finding that major patenting authorities have adopted a grace period having substantially the same effect” as those within the bill.⁷⁰ The term “major patenting authorities” is defined as “at least the patenting authorities in Europe and Japan.”⁷¹

Within the patent law, the priority rule addresses the circumstance where two or more persons independently develop the identical or similar invention at approximately the same time. In such cases the patent law must establish a rule as to which of these inventors obtains entitlement to a patent.⁷² Under current U.S. law, when more than one patent application is filed claiming the same invention, the patent will be awarded to the applicant who was the first inventor in fact. This conclusion holds even if the first inventor was not the first person to file a patent application directed towards that invention.⁷³ Within this “first-to-invent” system,⁷⁴ the timing of real-world events, such as the date a chemist conceived of a new compound or a machinist constructed a new engine, is of significance.

In every patent-issuing nation except the United States, priority of invention is established by the earliest effective filing date of a patent application disclosing the claiming invention.⁷⁵ Stated differently, the inventor who first filed an application at the patent office is presumptively entitled to the patent. Whether or not the first applicant was actually the first individual to complete the invention in the field is irrelevant. This priority system follows the “first-inventor-to file” principle.

⁶⁸ S. 1145, § 2.

⁶⁹ H.R. 1908, § 3.

⁷⁰ *Id.* at § 3(k).

⁷¹ *Id.* The European Patent Convention, which for nearly 30 years has provided the framework for European patent law, currently does not provide inventors with a generally applicable grace period during which they may publicly disclose their inventions without prejudice to their patent rights. *See* European Patent Convention, Art. 54, October 5, 1973, 13 I.L.M. 268. Under Japanese law, the grace period is six months. *See* Japanese Patent Act, Law No. 121 of 1959, art. 67-2-2. Under H.R. 1908, a U.S. shift to a first-inventor-to-file regime would require amendments to both of these laws, at a minimum.

⁷² *See* Roger E. Schechter & John R. Thomas, *Principles of Patent Law* § 1.2.5 (2d ed. 2004).

⁷³ In addition, the party that was the first to invent must not have abandoned, suppressed or concealed the invention. 35 U.S.C. § 102(g)(2).

⁷⁴ *See* Charles E. Gholz, “First-to-File or First-to-Invent?,” 82 *Journal of the Patent and Trademark Office Society* (2000), 891.

⁷⁵ *See* Peter A. Jackman, “Adoption of a First-to-File System: A Proposal,” 26 *University of Baltimore Law Review* (1997), 67.

A simple example illustrates the distinction between these priority rules. Suppose that inventor A synthesizes a new chemical compound on August 1, 2007, and files a patent application on November 1, 2007, claiming that compound. Suppose further that inventor B independently invents the same compound on September 1, 2007, and files a patent application on October 1, 2007. Inventor A would be awarded the patent under the first-to-invent rule, while Inventor B would obtain the patent under the first-inventor-to-file principle.

Under the current U.S. first-to-invent rule, priority disputes may be resolved via “interference” proceedings conducted at the USPTO.⁷⁶ An interference is a complex administrative proceeding that may result in the award of priority to one of its participants. These proceedings are not especially common. One estimate concludes that less than one-quarter of one percent of patents are subject to an interference.⁷⁷ This statistic may mislead, however, because the expense of interference cases may result in their use only for the most commercially significant inventions. A shift to a first-inventor-to-file priority rule would eliminate the need for interference proceedings. Instead, the applicant with the earliest filing date, rather than the first individual to have created the invention, would have been eligible for the patent.

The relative merits of the first-to-invent and first-inventor-to-file priority principles have been the subject of a lengthy debate within the patent community. Supporters of the current first-to-invent principle in part assert that the first-inventor-to-file system would create inequities by sponsoring a “race to the Patent Office.” They are also concerned that the first-to-file system would encourage premature and sketchy technological disclosures in hastily-filed patent applications.⁷⁸

Supporters of the first-inventor-to-file principle in part assert that it provides a definite, readily determined and fixed date of priority of invention, which would lead to greater legal certainty within innovative industries. They also contend that the first-inventor-to-file principle would decrease the complexity, length and expense associated with current USPTO interference proceedings. Rather than being caught up in lengthy interference proceedings in an attempt to prove dates of inventive activity that occurred many years previously, they assert, inventors could continue to go about the process of innovation. Supporters also observe that informed U.S. firms already organize their affairs on a first-inventor-to-file basis in order to avoid forfeiture of patent rights abroad.⁷⁹

⁷⁶ 35 U.S.C. § 135.

⁷⁷ See Clifford A. Ulrich, “The Patent Systems Harmonization Act of 1992: Conformity at What Price?,” 16 *New York Law School Journal of International and Comparative Law* (1996), 405.

⁷⁸ See Brad Pedersen & Vadim Braginsky, “The Rush to First-to-File Patent System in the United States: Is a Globally Standardized Patent Reward System Really Beneficial to Patent Quality and Administrative Efficiency?,” 7 *Minnesota Journal of Law, Science & Technology* (2006), 757.

⁷⁹ See Whitney E. Fraser Tiedemann, “First-to-File: Promoting the Goals of the United States Patent System as Demonstrated Through the Biotechnology Industry,” 41 *University of San Francisco Law Review* (2007), 477.

The effect of a shift to the first-inventor-to-file rule upon individual inventors, small firms, and universities has been debated. Some observers state that such entities often possess fewer resources and wherewithal than their larger competitors, and thus are less able to prepare and file patent applications quickly. Others disagree, stating that smaller concerns are more nimble than larger ones and thus better able to submit applications promptly. They also point to the availability of provisional applications,⁸⁰ asserting that such applications allow small entities to secure priority rights readily without a significant expenditure of resources. A quantitative study of interference proceedings by Gerald Mossinghoff, a former Commissioner of the USPTO, also suggested that the first-to-invent rule neither advantaged nor disadvantaged small entities vis-a-vis larger enterprises.⁸¹

Whether the U.S. Constitution places restraints upon the selection of a patent priority principle has also been debated. Article I, Section 8, clause 8 of the Constitution provides Congress with the authority to award “inventors” with exclusive rights. Some observers suggest this language suggests, or possibly even mandates, the current first-to-invent system. Others conclude that because the first-inventor-to-file only awards patents to individuals who actually developed the invention themselves, rather than derived it from another, this priority system is permissible under the Constitution.⁸²

In weighing the validity of this position, it should be noted that under well-established U.S. law, the first-inventor-in-fact does not always obtain entitlement to a patent. If, for example, a first-inventor-in-fact maintained his invention as a trade secret for many years before seeking patent protection, he may be judged to have “abandoned, suppressed or concealed” the invention.⁸³ In such a case a second-inventor-in-fact may be awarded a patent on that invention. Courts have reasoned that this statutory rule encourages individuals to disclose their inventions to the public promptly, or give way to an inventor who in fact does so.⁸⁴ As the first-inventor-to-file rule acts in a similar fashion to this longstanding patent law principle, conflict between this rule and the Constitution appears unlikely.

Notably, a first-inventor-to-file priority rule does not permit one individual to copy another’s invention and then, by virtue of being the first to file a patent application, be entitled to a patent. All patent applicants must have originated the invention themselves, rather than derived it from another.⁸⁵ In order to police this requirement, both bills would provide for “inventor’s rights contests” that would

allow the USPTO to determine which applicant is entitled to a patent on a particular invention.⁸⁶

Grace Period

S. 1145 would also alter the existing one-year “grace period” enjoyed by U.S. inventors.⁸⁷ H.R. 1908 would make the same change, contingent upon the President’s certification that “major patenting authorities” provide inventors with a grace period having substantially the same effect as the one proposed in the legislation.⁸⁸

Current U.S. patent law essentially provides inventors with a one-year period to decide whether patent protection is desirable, and, if so, to prepare an application. Specified activities that occur before the “critical date” — patent parlance for the day one year before the application was filed — will prevent a patent from issuing.⁸⁹ If, for example, an entrepreneur first discloses an invention by publishing an article in a scientific journal, she knows that she has one year from the publication date in which to file a patent application. Importantly, uses, sales, and other technical disclosures by third parties will also start the one-year clock running. As a result, inventors have a broader range of concerns than merely their own activities.⁹⁰

Suppose, for example, that an electrical engineer files a patent application claiming a new capacitor on February 1, 2007. While reviewing the application, a USPTO examiner discovers an October 1, 2005, journal article disclosing the identical capacitor. Because the article was published prior to the critical date of February 1, 2006, that publication will prevent or “bar” the issuance of a patent on that capacitor.

If a relevant reference is first publicly disclosed during the one-year grace period — that is to say, after the critical date but prior to the filing date — the legal situation is more complex. Under current law, patent applicants may “antedate” such a reference by demonstrating that they had actually invented the subject matter of their application prior to the date of the reference. If the applicant can make such a showing, then the reference cannot ordinarily be used to defeat the patentability of the invention.

As an illustration of this procedure, suppose that an inventor files a patent application directed to a polymer on February 1, 2007. Suppose further that the USPTO examiner discovers that a textbook published on January 1, 2007, describes

⁸⁶ H.R. 1908, § 3(i); S. 1145, § 3(i).

⁸⁷ S. 1145, § 2.

⁸⁸ H.R. 1908, § 3.

⁸⁹ 35 U.S.C. § 102(b).

⁹⁰ Schechter & Thomas, *supra*, at § 4.3.1.

the same polymer that is claimed in the application.⁹¹ Because the textbook was published subsequent to the critical date of February 1, 2006, it does not absolutely bar the application. In order to obtain a patent, however, the applicant must nonetheless demonstrate that he invented the polymer prior to January 1, 2007, the date the textbook was published. The applicant might submit copies of his laboratory notebook, for example, or submit a sworn declaration in order to make this showing.⁹²

S. 1145 would change, and H.R. 1908 could potentially change, the current grace period by causing it only to apply to patent applicants themselves. Under this proposal, “disclosures made by the inventor or a joint inventor or by others who obtained the subject matter disclosed directly or indirectly from the inventor or a joint inventor” would not be patent-defeating, provided they were made “one year or less before the effective filing date of the claimed invention.” In contrast, disclosures qualify as prior art, and are therefore potentially patent-defeating, if they were made either by (1) the inventors and their associates more than one year before the patent application’s filing date; or (2) anyone else prior to the filing date, provided that such a disclosure occurred prior to the inventor’s own disclosure. These amendments would, in essence, protect the patent positions of individuals who disclosed their inventions up to one year before they filed a patent application. The grace period would no longer shield inventors from earlier disclosures made by unrelated individuals, however.

Elimination of Sections 102(c), (d) and (f)

S. 1145 would also eliminate three provisions of the Patent Act, paragraphs (c), (d), and (f) of Section 102.⁹³ Once more, H.R. 1908 would make the same change, contingent upon the President’s certification that “major patenting authorities” provide inventors with a grace period having substantially the same effect as the one proposed in the legislation.⁹⁴

Section 102(c) does not allow an applicant to obtain a patent when he “has abandoned the invention.” This statute does not refer to disposal of the invention itself, however, but instead to the intentional surrender of an invention *to the public*. Older Supreme Court opinions instruct that abandonment may occur where an inventor expressly dedicates it to the public, through a deliberate relinquishment or conduct evidencing an intent not to pursue patent protection.⁹⁵ The circumstances must be such that others could reasonably rely upon the inventor’s renunciation.⁹⁶

⁹¹ In addition, the textbook must be attributable to someone other than the patent applicant. See 35 U.S.C. § 102(a).

⁹² 37 C.F.R. § 1.131.

⁹³ S. 1145, § 2.

⁹⁴ H.R. 1908, § 3.

⁹⁵ See *Beedle v. Bennett*, 122 U.S. 71 (1887).

⁹⁶ See *Mendenhall v. Astec Indus., Inc.*, 13 USPQ2d 1913, 1937 (E.D. Tenn. 1988), *aff’d*, (continued...)

Perhaps because few individuals expressly cede their patentable inventions to the public without seeking compensation, there are few modern judicial opinions that consider 35 U.S.C. § 102(c) in any meaningful way. In addition, the generally applicable principle of equitable estoppel may apparently be used to obtain the same result.⁹⁷

Like Section 102(c), Section 102(d) of the Patent Act is reportedly little-used.⁹⁸ 35 U.S.C. 102(d) bars a U.S. patent when (1) an inventor files a foreign patent application more than twelve months before filing the U.S. application, and (2) a foreign patent results from that application prior to the U.S. filing date. Suppose that an inventor files an application at a foreign patent office on May 25, 2006. The foreign application matures into a granted foreign patent on August 1, 2007. If the inventor has not filed his patent application at the USPTO as of August 1, 2007, the date of the foreign patent grant, any patent application that the inventor subsequently filed in the United States would be defeated.

35 U.S.C. § 102(d) is intended to encourage the prompt filing of patent applications in the United States. As the Patent Office Commissioner explained in 1870:

The intention of [C]ongress obviously was to obtain for this country the free use of the inventions of foreigners as soon as they became free abroad. This is indicated by the use of the phrase, ‘first patented, or caused to be patented, in a foreign country,’ for it was presumable that American citizens would obtain their first patent here, while a foreigner would first patent his invention in his own country. The statute was designed to prevent a foreigner from spending his time and capital in the development of an invention in his own country, and then coming to this country to enjoy a further monopoly, when the invention had become free at home. The result of such a course would be that while the foreign country was developing the invention and enjoying its benefits, its use could be interdicted here; while, if the term of the monopoly could be further extended here, the market could be controlled long after the foreign nation was prepared to flood this country with the unpatented products of the patented process.⁹⁹

Section 102(d) has been subject to critical commentary. Because inventors may choose to file a patent application only in the United States, the policy goal of assuring that the U.S. market will become patent-free contemporaneously with foreign markets may not be well-served by this provision. In addition, 35 U.S.C. § 102(d) effectively acts against foreign, rather than U.S.-based inventors, as domestic inventors ordinarily file at the USPTO first before seeking rights overseas. Some commentators have suggested that 35 U.S.C. § 102(d) violates the spirit, if not the

⁹⁷ *See generally* A.C. Auckerman & Co. v. R.L. Chaides Construction Co., 960 F.2d 1020 (Fed. Cir. 1992).

⁹⁸ Schechter & Thomas, *supra*, at § 4.3.8.

⁹⁹ *Bate Refrigerating Co. v. Sulzberger*, 157 U.S. 1, 27 (1895) (quoting *Ex parte Mushet*, 1870 Comm’r December 106, 108 (1870)).

letter, of U.S. international treaty obligations, which generally impose an obligation of national treatment with respect to intellectual property matters.¹⁰⁰

The third of these provisions, 35 U.S.C. § 102(f), states that a person may obtain a patent unless “he did not himself invent the subject matter sought to be patented.” This proposed amendment would not alter the requirement that only an actual inventor may obtain a patent, which is also stated by 35 U.S.C. § 101.¹⁰¹

Inventor’s Oath and Assignee Filing

Under current U.S. law, a patent application must be filed by the inventor — that is to say, the natural person or persons who developed the invention.¹⁰² This rule applies even where the invention was developed by individuals in their capacity as employees. Even though rights to the invention have usually been contractually assigned to an employer, for example, the actual inventor, rather than the employer, must be the one that applies for the patent. In particular, Section 115 of the Patent Act obliges each applicant must also submit an oath or declaration stating that he believes himself to be the “original and first inventor” of the subject matter for which he seeks a patent. Section 118 of the Patent Act allows a few exceptions to this general rule. If an inventor cannot be located, or refuses to perform his contractual obligation to assign an invention to his employer, then the employer may file the patent application in place of the inventor.

S. 1145 would modify these rules by incorporating the exceptions found in current Section 118 into Section 115 of the Patent Act.¹⁰³ This proposal appears to be primarily technical in nature, although a few changes between the proposed statute and present law exist. First, S. 1145 would require inventors to declare only that they are the “original inventor” — rather than the “original and first inventor” — in keeping with the proposed shift to a first-inventor-to-file priority system. Second, S. 1145 would allow an “individual who is under an obligation of assignment for patent [to] include the required statements . . . in the assignment executed by the individual, in lieu of filing such statements separately.” This provision comports with the allowance of the filing of patent applications by employers and other assignees of patent rights.

¹⁰⁰ See Toshiko Takenaka, “The Best Patent Practice or Mere Compromise? A Review of the Current Draft of the Substantive Patent Law Treaty and a Proposal for a ‘First-to-Invent’ Exception for Domestic Applicants,” 11 *Texas Intellectual Property Law Journal* (2003), 259.

¹⁰¹ See Schechter & Thomas, *supra*, at § 4.4.4. This amendment may potentially alter the holding in *Oddzon Products Inc. v. Just Toys Inc.*, 122 F.3d 1396 (Fed. Cir. 1997), that subject matter that qualifies as prior art only under 35 U.S.C. § 102(f) may be used for a nonobviousness analysis under 35 U.S.C. § 103(a). Further discussion of this issue may be found at CRS Report RL33063, *Intellectual Property and Collaborative Research*, by John R. Thomas.

¹⁰² 35 U.S.C. § 111.

¹⁰³ S. 1145, § 3(a); H.R. 1908, § 4(a).

S. 1145 would further stipulate that a “person to whom the inventor has assigned or is under an obligation to assign the invention may make an application for patent.”¹⁰⁴ Individuals who otherwise make a showing of a “sufficient proprietary interest in the matter” may also apply for a patent on behalf of the inventor upon a sufficient show of proof of the pertinent facts. Under S. 1145, if the USPTO “Director grants a patent on an application filed under this section by a person other than the inventor, the patent shall be granted to the real party in interest and upon such notice to the inventor as the Director considers to be sufficient.”

H.R. 1908 also introduces a number of changes to existing Section 115 of the Patent Act, but does not amend Section 118. Like its counterpart in the Senate, H.R. 1908 would allow an “individual who is under an obligation of assignment for patent [to] include the required statements . . . in the assignment executed by the individual, in lieu of filing such statements separately.”¹⁰⁵

Legal reforms allowing assignee filing of patent applications have been discussed for many years, with two well-known commissions of patent experts encouraging this shift. A 1966 Report of the President’s Commission on the Patent System recommended the allowance of assignee filing as a way to simplify formalities of application filing and to avoid delays caused by the need to identify and obtain signatures from each inventor.¹⁰⁶ The 1992 Advisory Commission on Patent Law Reform was also in favor of this change. The 1992 Commission observed that the United States was “the only country which does not permit the assignee of an invention to file a patent application in its own name.”¹⁰⁷ In the opinion of the 1992 Commission, assignee filing would appropriately accompany a U.S. shift to a first-inventor-to-file priority system, as the reduction of formalities would allow innovative enterprises to file patent applications more promptly.

The 1992 Commission also explained that adoption of assignee filing may have some negative consequences. The Commission noted that patent applications filed by assignees may lack the actual inventor’s personal guarantee that the application was properly prepared. In addition, assignee filing might derogate the right of natural persons to their inventions. In the opinion of the Commission, however, the advantages of assignee filing outweighed the disadvantages.¹⁰⁸

Apportionment of Damages

H.R. 1908 and S. 1145 also address monetary remedies in patent cases. Marketplace realities often render the determination of an appropriate damages award

¹⁰⁴ S. 1145, § 3(b).

¹⁰⁸ *Ibid.*

a difficult affair in patent litigation. In some cases, the product or process that is found to infringe may incorporate numerous additional elements beyond the patented invention. For example, the asserted patent may relate to a single component of an audio speaker, while the accused product consists of the entire stereo system. In such circumstances, a court may apply “the entire market value rule,” which “permits recovery of damages based upon the entire apparatus containing several features, where the patent-related feature is the basis for consumer demand.”¹⁰⁹ On the other hand, if the court determines that the infringing sales were due to many factors beyond the use of the patented invention, the court may apply principles of “apportionment” to measure damages based upon the value of the patented feature alone.¹¹⁰

Some observers believe that courts have sometimes been overly generous in assessing damages in patent cases. As one commentator asserted:

[B]road application of the entire market value rule appears to broaden the practical scope of a remedy for patent infringement beyond the legal scope of the patent and despite careful attention to a precise and proper construction of claim terms. Further, although the entire market value rule was conceived to ensure a proper level of damages for the infringement by recognizing a patent’s value that went beyond sales of a single product, the courts’ abandonment of a meaningful “basis of consumer” demand test requires an infringer to pay damages for an entire system, despite that the patent has been issued on only a narrow piece that has little market impact on sales of unpatented components. Similarly, failing to provide subsequent inventors with clear notice of their potential liability by uneven application of the entire market value rule may chill innovation and interfere with the public notice requirements on which the patent laws depend. Overcompensating initial inventors and over-detering subsequent inventors interferes with the balance sought to be struck by proper claim interpretation.¹¹¹

Other commentators disagree, believing that current case law appropriately incorporates apportionment principles. These commentators also believe that the proposed reforms would diminish the value of the patent right to the detriment of the innovation environment of the United States. One observer states:

Courts have had little difficulty applying the current law on apportionment and the entire market value rule to reach just and reasonable findings on assessment of damages

Patent infringement damages ... are the culmination of the courts’ long and careful efforts to adhere to the statutory requirement to provide damages adequate to compensate for the infringement of an inventor’s patent. Apportionment recognizes the reality that consumer demand for an infringing product or process may in part spring from contributions from the infringer, and to reward the inventor for those contributions is inappropriate. On the other hand,

¹⁰⁹ *State Indus., Inc. v. Mor-Flo Indus., Inc.*, 883 F.2d 1573, 1580 (Fed. Cir. 1989).

¹¹⁰ *Dowagiac Mfg. Co. v. Minn. Moline Plow Co.*, 235 U.S. 641 (1915).

¹¹¹ Amy L. Landers, “Let the Games Begin: Incentives to Innovation in the New Economy of Intellectual Property Law,” 46 *Santa Clara Law Review* (2006), 364-65.

the entire market value rule recognizes the reality that even complex assemblies may owe their marketability to a patented feature — a feature that drives consumer demand for the overall assembly. In those cases, it is entirely appropriate to reward the inventor according to the worth of her invention. To do otherwise would only encourage those who trespass and discourage inventors from making their intellectual efforts available to the public. The courts can be and are flexible in assessing each case on its merits, and they can reliably determine the correct royalty base and rate that will award “damages adequate to compensate for the infringement.”¹¹²

In brief, H.R. 1908 calls for a court to select one of the following methods for determining a “reasonable royalty” as the measure of damages: (1) the economic value of the properly attributable to the patent’s specific contribution over the prior art, (2) the entire market value rule, or (3) other factors, such as terms of the nonexclusive marketplace licensing of the invention.¹¹³ S. 1145 requires courts to select the method for calculating reasonable royalties from either (1) the entire market value rule, (2) an established royalty based upon marketplace licensing, or (3) the economic value of the infringement attributable to the claimed invention’s specific contribution over the prior art.¹¹⁴

Views differ on the appropriateness of this reform. Some believe that current damages standards have resulted in the systemic overcompensation of patent owners. Such overcompensation may place unreasonable royalty burdens upon producers of high technology products, ultimately impeding the process of technological innovation and dissemination that the patent system is meant to foster. Others believe that current case law appropriately accounts for apportionment concerns. These observers are concerned that this reform might overly restrict damages in patent cases, thereby discouraging voluntary licensing and promoting infringement of patent rights. Limited damage awards for patent infringement might prevent innovators from realizing the value of their inventive contributions, a principal goal of the patent system.

Willful Infringement

H.R. 1908 and S. 1145 propose to reform the law of willful infringement. The patent statute currently provides that the court “may increase the damages up to three times the amount found or assessed.”¹¹⁵ An award of enhanced damages, as well as the amount by which the damages will be increased, is committed to the discretion of the trial court.¹¹⁶ Although the statute does not specify the circumstances in which enhanced damages are appropriate, the Federal Circuit recently explained that “a

¹¹³ H.R. 1908, § 5(a).

¹¹⁴ S. 1145, § 4(a).

¹¹⁵ 35 U.S.C. § 284.

¹¹⁶ *See Read Corp. v. Portec, Inc.*, 970 F.2d 816, 826 (Fed. Cir. 1992).

patentee must show by clear and convincing evidence that the infringer acted despite an objectively high likelihood that its actions constituted infringement of a valid patent.”¹¹⁷ This circumstance is termed “willful infringement.”¹¹⁸

Courts will not ordinarily enhance damages due to willful infringement if the adjudicated infringer did not know of the patent until charged with infringement in court, or if the infringer acted with the reasonable belief that the patent was not infringed or that it was invalid. Prior to the 2007 decision in *In re Seagate Technology*, Federal Circuit decisions emphasized the duty of someone with actual notice of a competitor’s patent to exercise due care in determining if his acts will infringe that patent.¹¹⁹ In *Seagate Technology*, however, the Federal Circuit opted to “abandon the affirmative duty of due care.”¹²⁰ The court of appeals instead explained that “proof of willful infringement permitting enhanced damages requires at least a showing of objective recklessness.”¹²¹

Prior to 2004, the Federal Circuit held that when an accused infringer invoked the attorney-client or work-product privilege, courts should be free to reach an adverse inference that either (1) no opinion had been obtained or (2) an opinion had been obtained and was contrary to the infringers’ desire to continue practicing the patented invention.¹²² However, in its decision in *Knorr-Bremse Systeme fuer Nutzfahrzeuge GmbH v. Dana Corp.*,¹²³ the Federal Circuit expressly overturned this principle. The Court of Appeals further stressed that the failure to obtain legal advice did not occasion an adverse inference with respect to willful infringement either. Following the *Knorr-Bremse* opinion, willful infringement determinations are based upon “the totality of circumstances, but without the evidentiary contribution or presumptive weight of an adverse inference that any opinion of counsel was or would have been unfavorable.”¹²⁴

Patent law’s willful infringement doctrine has proven controversial. Some observers believe that this doctrine ensures that patent rights will be respected in the marketplace. Critics of the policy believe that the possibility of trebled damages discourages individuals from reviewing issued patents. Out of fear that their inquisitiveness will result in multiple damages, innovators may simply avoid looking at patents until they are sued for infringement. To the extent this observation is correct, the law of willful infringement discourages the dissemination of technical

¹²⁴ *Ibid.* at 1341.

knowledge, thereby thwarting one of the principal goals of the patent system. Fear of increased liability for willful infringement may also discourage firms from challenging patents of dubious validity. Consequently some have argued that the patent system should shift to a “no-fault” regime of strictly compensatory damages, without regard to the state of mind of the adjudicated infringer.¹²⁵

H.R. 1908 and S. 1145 include identical language that would add several clarifications and changes to the law of willful infringement. First, a finding of willful infringement would be appropriate only where (1) the infringer received specific written notice from the patentee and continued to infringe after a reasonable opportunity to investigate; (2) the infringer intentionally copied from the patentee with knowledge of the patent; or (3) the infringer continued to infringe after an adverse court ruling. Second, willful infringement cannot be found where the infringer possessed an informed, good faith belief that its conduct was not infringing. Finally, a court may not determine willful infringement before the date on which the court determines that the patent is not invalid, enforceable, and infringed.¹²⁶

Marking

The Patent Act encourages patent proprietors that manufacture their patented inventions to notify the public of their patent rights. Section 287(a) provides that patent owners should place the word “patent,” or the abbreviation “pat.,” along with the number of the patent, on patented goods. If the nature of the article does not allow this notice to be placed directly upon it, then a label may be placed on the article or its packaging. This practice is commonly termed “marking.”¹²⁷

There is no absolute duty to mark. If a patent proprietor fails to mark in the specified manner, however, then it may receive damages only for infringing acts that occur after the infringer receives actual notice of infringement.¹²⁸ Filing an infringement lawsuit is considered to provide such actual notice. Less severely, a patent owner may issue a specific charge of infringement, commonly by sending a cease and desist letter to the infringer. The marking statute is said “to give patentees the proper incentive to mark their products and thus place the world on notice of the existence of the patent.”¹²⁹

The marking statute does not apply in some situations. Obviously, if the patent owner does not sell products that embody the patented invention, then there is no obligation to mark. In addition, “[t]he law is clear that the notice provisions of

¹²⁵ See generally Schechter & Thomas, *supra*, at § 9.2.5.

¹²⁶ H.R. 1908, § 5(a); S. 1145, § 4(a).

¹²⁷ See Schechter & Thomas, *supra*, at § 9.2.3.

¹²⁸ It should be further appreciated that under 35 U.S.C. § 286, “no recovery shall be had for any infringement committed more than six years prior to the filing of the complaint or counterclaim for infringement in the action.”

¹²⁹ *Laitram Corp. v. Hewlett-Packard Co.*, 806 F. Supp. 1294, 1296 (E.D. La. 1992).

section 287 do not apply where the patent is directed to a process or method.”¹³⁰ Because these types of patent concern inchoate behavior, rather than a discrete physical product, the courts have reasoned that there is no tangible item on which to place a patent marking.¹³¹

S. 1145 would somewhat modify patent damages law in situations where the current marking statute does not apply. Under that proposal, where there is no obligation to mark — either because the patent owner does not market the patented product, the asserted patent is directed towards a process or method, or for some other reason — “no recovery shall be had for any infringement committed more than 2 years prior to the filing of the complaint” unless the patent owner had provided notice of infringement. If notice is provided, the patent owner may recover damages for infringement for up to two years prior to such notice, as well as for infringing acts committed after such notice.¹³²

The amendments proposed by S. 1145 appear to support the same policy goal as the marking statute — in particular, notice of the existence of patent rights to interested parties — in circumstances where the marking statute does not currently apply. No comparable provision appears in H.R. 1908.

Prior User Rights

S. 1145 would broaden the “first inventor defense” established by the American Inventors Protection Act of 1999. As currently found at 35 U.S.C. § 273, an earlier inventor of a “method of doing or conducting business” that was later patented by another may claim a defense to patent infringement in certain circumstances. S. 1145 would allow the defense to apply as well to affiliates of the entity that qualifies for the defense.¹³³ No comparable provision appears in H.R. 1908.

The existing “first inventor defense” accounts for the complex relationship between the law of trade secrets and the patent system. Trade secrecy protects individuals from misappropriation of valuable information that is useful in commerce. One reason an inventor might maintain the invention as a trade secret rather than seek patent protection is that the subject matter of the invention may not be regarded as patentable. Such inventions as customer lists or data compilations have traditionally been regarded as amenable to trade secret protection but not to patenting.¹³⁴ Inventors might also maintain trade secret protection due to ignorance

¹³⁰ *American Med. Sys., Inc. v. Medical Eng’g Corp.*, 6 F.3d 1523, 1538 (Fed. Cir. 1993).

¹³¹ *See State Contracting & Eng’g Corp. v. Condotte Am., Inc.*, 346 F.3d 1057, 1074 (Fed. Cir. 2003).

¹³³ S. 1145, § 4(d).

¹³⁴ Restatement of Unfair Competition § 39.

of the patent system or because they believe they can keep their invention as a secret longer than the period of exclusivity granted through the patent system.¹³⁵

The patent law does not favor trade secret holders, however. Well-established patent law provides that an inventor who makes a secret, commercial use of an invention for more than one year prior to filing a patent application at the USPTO forfeits his own right to a patent.¹³⁶ This policy is based principally upon the desire to maintain the integrity of the statutorily prescribed patent term. The patent law grants patents a term of twenty years, commencing from the date a patent application is filed.¹³⁷ If the trade secret holder could make commercial use of an invention for many years before choosing to file a patent application, he could disrupt this regime by delaying the expiration date of his patent.

On the other hand, settled patent law principles established that prior secret uses would not defeat the patents of later inventors.¹³⁸ If an earlier inventor made secret commercial use of an invention, and another person independently invented the same technology later and obtained patent protection, then the trade secret holder could face liability for patent infringement. This policy is based upon the reasoning that once issued, published patent instruments fully inform the public about the invention, while trade secrets do not. As between a subsequent inventor who patented the invention, and thus had disclosed the invention to the public, and an earlier trade secret holder who had not, the law favored the patent holder.

An example may clarify this rather complex legal situation. Suppose that Inventor A develops and makes commercial use of a new manufacturing process. Inventor A chooses not to obtain patent protection, but rather maintains that process as a trade secret. Many years later, Inventor B independently develops the same manufacturing process and promptly files a patent application claiming that invention. In such circumstances, Inventor A's earlier, trade secret use does not prevent Inventor B from procuring a patent. Furthermore, if the USPTO approves the patent application, then Inventor A faces infringement liability should Inventor B file suit against him.

The American Inventors Protection Act of 1999 somewhat modified this principle. That statute in part provided an infringement defense for an earlier inventor of a "method of doing or conducting business" that was later patented by another. By limiting this defense to patented methods of doing business, Congress responded to the 1998 Federal Circuit opinion in *State Street Bank and Trust Co. v. Signature Financial Group*.¹³⁹ That judicial opinion recognized that business

¹³⁹ 149 F.3d 1368 (Fed. Cir. 1998).

methods could be subject to patenting, potentially exposing individuals who had maintained business methods as trade secrets to liability for patent infringement.

Again, an example may aid understanding of the first inventor defense. Suppose that Inventor X develops and exploits commercially a new method of doing business. Inventor X maintains his business method as a trade secret. Many years later, Inventor Y independently develops the same business method and promptly files a patent application claiming that invention. Even following the enactment of the American Inventors Protection Act, Inventor X's earlier, trade secret use would not prevent Inventor Y from procuring a patent. However, should the USPTO approve Inventor Y's patent application, and should Inventor Y sue Inventor X for patent infringement, then Inventor X may potentially claim the benefit of the first inventor defense. If successful,¹⁴⁰ Inventor X would enjoy a complete defense to infringement of Inventor Y's patent.

S. 1145 would more modestly expand the first inventor defense as it was established in 1999. The defense currently applies to "the person who performed the acts necessary to establish the defense"¹⁴¹ S. 1145 would also allow "any other entity that controls, is controlled by, or is under common control" with that person to claim entitlement to the first inventor defense.¹⁴²

Post-Grant Review Proceedings

Pending legislation in the 110th Congress would introduce post-grant review proceedings into U.S. patent law. Post-issuance review proceedings, which are common in foreign patent regimes, are patent revocation proceedings that are usually administered by authorities from the national patent office. Typically known as "oppositions," these proceedings often involve a wide range of potential invalidity arguments and are conducted through adversarial hearings that resemble courtroom litigation.

Although the U.S. patent system does not currently include full-fledged post-grant review proceedings in the manner of an opposition, the U.S. patent system has incorporated a so-called reexamination proceeding since 1981. Under the reexamination statute, any individual, including the patentee, a competitor, and even the USPTO Director, may cite a prior art patent or printed publication to the USPTO. If the USPTO determines that this reference raises a "substantial new question of patentability" with respect to an issued patent, then it will essentially reopen prosecution of the issued patent.

¹⁴⁰ As presently codified at 35 U.S.C. § 273, the first inventor defense is subject to a number of additional qualifications. First, the defendant must have reduced the infringing subject matter to practice at least one year before the effective filing date of the application. Second, the defendant must have commercially used the infringing subject matter prior to the effective filing date of the patent. Finally, any reduction to practice or use must have been made in good faith, without derivation from the patentee or persons in privity with the patentee.

¹⁴¹ 35 U.S.C. § 273(b)(6).

¹⁴² S. 1145, § 4(d).

Traditional reexamination proceedings are conducted in an accelerated fashion on an *ex parte* basis. Following the American Inventors Protection Act of 1999, an *inter partes* reexamination allows the requester to participate more fully in the proceedings through the submission of arguments and the filing of appeals. Either sort of reexamination may result in a certificate confirming the patentability of the original claims, an amended patent with narrower claims or a declaration of patent invalidity.

Congress intended reexamination proceedings to serve as an inexpensive alternative to judicial determinations of patent validity.¹⁴³ Reexamination also allows further access to the legal and technical expertise of the USPTO after a patent has issued.¹⁴⁴ However, some commentators believe that reexamination proceedings have been employed only sparingly and question their effectiveness.¹⁴⁵

Both the House and Senate bills propose an additional post-issuance proceeding termed a “post-grant review proceeding,” which are similar in broad aspect but differ on many significant details. The two bills provide that any person other than the patent proprietor may commence this proceeding. Under H.R. 1908, the proceeding may begin either within 12 months of the date the patent was issued or at any time if the patent proprietor so consents.¹⁴⁶ S. 1145 additionally allows the proceeding to begin within 12 months after the challenger has received notice from the patent holder alleging infringement, provided that the challenger establishes a “substantial reason” that the “continued existence of the challenged claim causes or is likely to cause the petitioner significant economic harm.”¹⁴⁷

H.R. 1908 and S. 1145 afford the patent proprietor a single opportunity to amend its patent during the post-grant review proceeding, with further opportunities available with good cause shown. The USPTO would be required to reach a final decision within one year of commencement of the proceeding, with an extension possible of up to six months for good cause shown. Should the patent survive the post-grant review proceeding, the individual who commenced the proceeding, along with his privies, are barred in the future from raising issues that were previously aired before the USPTO. The two bills also provide the USPTO Director with authority to establish regulations to govern post-grant review proceedings.

¹⁴⁴ Craig Allen Nard, “Certainty, Fence Building and the Useful Arts,” 74 *Indiana Law Journal* (1999), 759.

¹⁴⁵ See Schechter & Thomas, *supra*, at § 7.5.4.

¹⁴⁶ H.R. 1908, § 6(b).

¹⁴⁷ S. 1145, § 5(c)(1).

The House and Senate bills vary with respect to *inter partes*¹⁴⁸ reexamination proceedings. S. 1145 would eliminate these proceedings entirely,¹⁴⁹ while H.R. 1908 would augment them.¹⁵⁰ Under the House bill, *inter partes* reexaminations would be conducted by an administrative law judge.

Some analysts have expressed concern that potential requesters are discouraged from commencing *inter partes* reexamination proceedings due to a statutory provision that limits their future options. In order to discourage abuse of these proceedings, the *inter partes* reexamination statute provides that third-party participants may not later assert that a patent is invalid “on any ground that [they] raised or could have raised during the *inter partes* reexamination proceedings.”¹⁵¹ Some observers believe that this potential estoppel effect disinclines potential requesters from use of this post-issuance proceeding. In apparent response to this concern, H.R. 1908 would delete the phrase “or could have raised” from the statute.¹⁵² As a result, *inter partes* reexamination requesters would be limited only with respect to arguments that they actually made before the USPTO.

Many observers have called for the United States to adopt a more effective post-grant administrative revocation system in order to provide more timely, lower cost, and more efficient review of issued patents.¹⁵³ Such a system could potentially improve the quality of issued patents by weeding out invalid claims. It might also encourage innovative firms to review issued patents soon after they are granted, thereby increasing the opportunity for technology spillovers.¹⁵⁴ However, concerns have arisen over oppositions because they too may be costly, complex, and prone to abuse as a means for harassing patent owners.¹⁵⁵ A successful post-grant review proceeding will require a balancing of these issues.

¹⁴⁸ The term “*inter partes*” may be literally translated as “between parties,” and ordinarily implies proceedings that involve parties with adverse interests. In contrast, the term “*ex parte*” generally means a proceeding commenced by a single party, without argument by persons who possess adverse interests. As used in the context of USPTO proceedings, an *inter partes* reexamination allows both the patent challenger and the patent owner to participate in the USPTO proceeding. In an *ex parte* reexamination, the patent challenger may initiate the proceeding and respond to the patent owner’s preliminary statement, but may not further participate in the *ex parte* reexamination.

Publication of Pending Applications

Until recent years, the U.S. patent system maintained pending patent applications in secrecy. The first moment that the public would become aware of the existence of a U.S. patent application was the day the USPTO formally allowed it to issue as a granted patent. This regime advantaged patent applicants because it allowed them to understand exactly what the scope of any allowed claims might be prior to disclosing an invention. Thus, if the applicant was able to maintain the invention that was subject to a patent application as a trade secret, then he could choose between obtaining the allowed patent claims and trade secret status. In addition, because the invention was not disclosed prior to the award of formal patent rights, unscrupulous competitors were discouraged from copying the invention.

However, this secrecy regime has been perceived as imposing costs as well. Others might well engage in duplicative research efforts during the pendency of patent applications, unaware that an earlier inventor had already staked a claim to that technology. This arrangement also allowed inventors to commence infringement litigation on the very day a patent issued, without any degree of notice to other members of the technological community.¹⁵⁶

Industry in the United States possessed one mechanism for identifying pending U.S. patent applications. Most foreign patent regimes publish all pending patent applications approximately 18 months after they have been filed.¹⁵⁷ As a result, savvy firms in the United States could review pending applications filed before foreign patent offices, and make an educated guess as to the existence of a corresponding U.S. application. This effort was necessarily inexact, however, particularly as some inventors either lacked the resources, or made the strategic decision, not to obtain patent rights outside the United States.

In enacting the American Inventors Protection Act of 1999, Congress for the first time introduced the concept of pre-grant publication into U.S. law. Since November 29, 2000, U.S. patent applications have been published 18 months from the date of filing, with some exceptions. The most significant of these exceptions applies where the inventor represents that he will not seek patent protection abroad. In particular, if an applicant certifies that the invention disclosed in the U.S. application will not be the subject of a patent application in another country that requires publication of applications 18 months after filing, then the USPTO will not publish the application.¹⁵⁸ As a result, inventors who do not wish to seek foreign patent rights retain the possibility of avoiding pre-grant publication.

H.R. 1908 and S. 1145 would further modify the U.S. pre-grant publication system, but they would do so in different ways. Under S. 1145, all pending applications to be published approximately 18 months after they are filed. Under

¹⁵⁶ Schechter & Thomas, *supra*, at § 7.2.6.

¹⁵⁷ John C. Todaro, "Potential Upcoming Changes in U.S. Patent Laws: the Publication of Patent Applications," 36 *IDEA: Journal of Law and Technology* (1996), 309.

¹⁵⁸ 35 U.S.C. § 122(b).

H.R. 1908, domestic-only applications would be published “three months after a second [USPTO] office action” or 18 months after filing, whichever is the later date.¹⁵⁹ The House bill would apparently allow the applicant some time to assess whether the USPTO would grant a patent with claims of satisfactory scope prior to disclosing the invention publicly. As a result, although both bills would eliminate the possibility of opting out of pre-grant publication by certifying that a patent will be sought only in the United States, the precise timing of the publication of those applications potentially differs.¹⁶⁰

Pre-Issuance Submissions

Both H.R. 1908 and S. 1145 would expand the ability of members of the public to submit information to the USPTO that is pertinent to pending applications. Under current law, interested individuals may enter a protest against a patent application. The protest must specifically identify the application and be served upon the applicant. The protest must also include a copy and, if necessary, an English translation, of any patent, publication or other information relied upon. The protester also must explain the relevance of each item.¹⁶¹

Protest proceedings have traditionally played a small role in U.S. patent practice. Until Congress enacted the American Inventors Protection Act of 1999, the USPTO maintained applications in secrecy. Therefore, the circumstances in which members of the public would learn of the precise contents of a pending patent application were relatively limited. With the USPTO commencing publication of some pending patent applications, protests would seem far more likely. Seemingly aware of this possibility, the 1999 Act provided that the USPTO shall “ensure that no protest or other form of pre-issuance opposition ... may be initiated after publication of the application without the express written consent of the applicant.”¹⁶² Of course, the effect of this provision is to eliminate the possibility of protest in exactly that class of cases where the public is most likely to learn of the contents of a pending application.

Through rulemaking, the USPTO has nonetheless established a limited mechanism for members of the public to submit information they believe is pertinent to a pending, published application. The submitted information must consist of either a patent or printed publication, and it must be submitted within two months of the date the USPTO published the pending application. Nondocumentary information that may be relevant to the patentability determination, such as sales or public use of the invention, will not be considered.¹⁶³ In addition, because Congress stipulated that no protest or pre-grant opposition may occur absent the consent of the

¹⁶³ 37 C.F.R. § 1.99.

patent holder, the USPTO has explained that it will not accept *comments* or *explanations* concerning the submitted patents or printed publications. If such comments are attached, USPTO staff will redact them before the submitted documents are forwarded to the examiner.¹⁶⁴

The proposed legislation would augment the possibility for pre-issuance submissions. Under both the House and Senate bills, any person may submit patent documents and other printed publications to the USPTO for review. Such prior art must be submitted within the later date of either (1) the date the USPTO issues a notice of allowance to the patent applicant; or (2) either six months after the date of pre-grant publication of the application, or the date of the rejection of any claim by the USPTO examiner. Such a submission must include “a concise description of the asserted relevance of each submitted document.”¹⁶⁵

Most observers agree that ideally, the USPTO should have access to all pertinent information when making patentability determinations. A more expansive pre-issuance submission policy may allow members of the public to disclose relevant patents and other documents that the USPTO’s own searchers may not have revealed, thereby leading to more accurate USPTO decision making. On the other hand, lengthy pre-issuance submissions may merely be repetitive of the USPTO’s own search results, but still require extensive periods of examiner review that might ultimately delay examination. The pending proposals attempt to balance these concerns by expanding existing opportunities for post-publication submissions, but limiting the timing and nature of those submissions so as to prevent undue burdens upon the USPTO and patent applicants.

Tax Planning Method Patents

Congressional interest in the recently recognized phenomenon of patented tax planning methods has been evidenced by proposed legislation in both the House and Senate.¹⁶⁶ These legislative initiatives responded to the issuance and enforcement of patents on methods that individuals and enterprises might use in order to minimize their tax obligations.¹⁶⁷ H.R. 1908 proposes to introduce language into the Patent Act stipulating that “[a] patent may not be obtained for a tax planning method.”¹⁶⁸ No analogous provision appears in S. 1145.

Tax planning method patents have been the subject of a spirited debate. Some observers believe that such patents negatively impact social welfare. According to

¹⁶⁸ H.R. 1908, § 10.

some experts, tax planning method patents may limit the ability of taxpayers to utilize provisions of the tax code, interfering with congressional intent and leading to distortions in tax obligations.¹⁶⁹ Others assert that tax planning method patents potentially complicate legal compliance by tax professionals and taxpayers alike.¹⁷⁰ Still others believe that the patent system should not provide incentives for individuals to develop new ways to reduce their tax liability.¹⁷¹

Some commentators explain that patents concerning the broader category of “business methods” have been obtained and enforced for many years.¹⁷² Legislation enacted in 1999 that accounted expressly for patents claiming “a method of doing or conducting business” arguably approved of such patents.¹⁷³ In addition, some observers believe that tax planning method patents present a positive development, potentially improving the public disclosure of tax shelters for the attention of Congress and federal tax authorities.¹⁷⁴ They also assert that many kinds of patents, on subject matter ranging from automobile seat belts to airplane navigation systems, potentially involve legal compliance.¹⁷⁵

Venue

Both H.R. 1908 and S. 1145 would reform the venue provision that applies to patent infringement cases in federal court.¹⁷⁶ The requirement of venue complements the more fundamental requirement of jurisdiction in federal litigation. In particular, venue addresses the question of which court, out of those that possess personal and

¹⁷⁶ In addition, S. 1145 would alter the venue of suits where the USPTO is a party from the District Court for the District of Columbia to the District Court for the Eastern District of Virginia. S. 1145, § 8(c).

subject matter jurisdiction, may most conveniently hear the specific lawsuit in question.¹⁷⁷

Congress has enacted a specialized venue statute that applies only to patent cases. 28 U.S.C. § 1400(b) provides that in patent litigation, venue is proper either: (1) in the judicial district where the defendant resides, or (2) where the defendant has committed acts of infringement and has a regular and established place of business. An important question under this provision is where a corporation is deemed to “reside.” Prior to 1988, a corporation was viewed as residing in its state of incorporation.¹⁷⁸ Commentators have explained that during this period, the patent venue statute was fairly restrictive, tending to move infringement litigation into the defendant’s seat of operations.¹⁷⁹

Congressional amendments subsequently liberalized venue concepts in patent litigation. In 1988, Congress adopted a new definition of “reside” as it applies to venue for corporate defendants.¹⁸⁰ Under the new definition, a corporation is presumed to reside in any judicial district to which it could be subject to personal jurisdiction at the time the litigation commences. Congress codified this change in a separate provision found at 28 U.S.C. § 1391. Although there is no evidence that Congress contemplated that these reforms would hold consequences for the specialized patent venue statute, the Federal Circuit nonetheless held that this amendment should also be read into § 1400(b).¹⁸¹

The result of the 1988 amendments has been significant for corporate defendants, which constitute the majority of defendants in patent litigation. Although § 1400(b) still governs venue in patent cases, few, if any plaintiffs rely upon the restrictive second prong of that section. Instead they base venue upon the “residence” requirement of the first prong — which now is entirely coterminous with personal jurisdiction, and which for larger corporations is likely to include every federal district in the country. For corporate defendants, then, the venue statute has essentially become superfluous, for the same standards governing personal jurisdiction also dictate whether a court may provide an appropriate venue or not.

Some observers allege that the liberal venue statute promotes forum shopping, allowing patent proprietors to bring suit in courts that they believe favor patent owners over accused infringers. One such “magnet jurisdiction” is said to be the rural Eastern District of Texas, and in particular the Marshall, Texas federal court. According to one account, many observers “wonder how an East Texas town of 25,000 — even if it was named after Supreme Court Justice John Marshall — came

¹⁸¹ *VE Holding Corp. v. Johnson Gas Appliance Co.*, 917 F.2d 1574 (Fed. Cir. 1990).

to harbor an oversized share of intellectual property disputes.”¹⁸² In addition, reportedly “many of the local lawyers who once specialized in personal injury cases are turning their attention to intellectual property law.”¹⁸³ Others believe that the existence of a single appellate court for patent cases, the Federal Circuit, minimizes forum shopping concerns, and that certain district courts attract patent cases due to their expertise and timeliness, rather than an inherent favoritism for patent holders.

S. 1145 would amend § 1400(b) by providing for venue (1) in the judicial district where either party resides, or (2) where the defendant has committed acts of infringement and has a regular and established place of business. S. 1145 further stipulates that, notwithstanding § 1391, for purposes of venue in patent cases “a corporation shall be deemed to reside in the judicial district in which the corporation has its principal place of business or in the State in which the corporation is incorporated.”¹⁸⁴ The amendments contemplated by H.R. 1908 are more complex, but in essence call for venue (1) where the defendant has its principal place of business, (2) where the defendant has committed a substantial portion of its acts of infringement and has an established physical facility, (3) if the plaintiff is an institution of higher education, individual, or small business, the plaintiff’s residence, or (4) the place of the plaintiff’s established physical facility devoted to research, development, or manufacturing.¹⁸⁵

Interlocutory Claim Construction Appeals

Pending legislation would allow a litigant to pursue an interlocutory appeal¹⁸⁶ of a patent claim construction order to the Court of Appeals for the Federal Circuit. This provision appears to be motivated by the recognition that the interpretation of a patent claims — a process that in large measure determines the scope of the patent owner’s proprietary rights — is the most fundamental inquiry that occurs during patent litigation.¹⁸⁷ In addition, numerous observers have perceived the Federal Circuit to have a high reversal rate of claim interpretations by the district courts.¹⁸⁸ Because claim construction is commonly the central focus of a patent trial, the Federal Circuit’s reversal of that construction often requires the district court to retry

¹⁸² Allen Pusey, “Marshall Law: Patent Lawyers Flood to East Texas Court for Its Expertise and ‘Rocket Docket’,” *Dallas Morning News* (March 26, 2006), 1D.

¹⁸³ *Ibid.*

¹⁸⁴ S. 1145, § 8(a).

¹⁸⁵ H.R. 1908, § 11(a).

¹⁸⁶ An “interlocutory appeal” is an appeal that occurs before the trial court’s final ruling on the entire case. *See* 28 U.S.C. § 1292(b) (2006). In this context, the interlocutory appeal concerning claim construction issues would occur before the court decides additional issues, such as whether there has been an infringement and the amount of damages to be awarded to the patent owner.

¹⁸⁷ *See* Joseph Scott Miller, “Enhancing Patent Disclosure for Faithful Claim Construction,” 9 *Lewis & Clark Law Review* (2005), 177.

¹⁸⁸ *See* Kimberly A. Moore, “Are District Court Judges Equipped to Resolve Patent Cases?,” 12 *Federal Circuit Bar Journal* (2002), 1.

the entire case. As patent litigation is a notoriously lengthy and costly exercise, some observers believe that the current system is overly expensive and inefficient.¹⁸⁹

Some commentators have opined that allowing an immediate appeal of patent claim construction orders would allow Federal Circuit review before the litigants are put to the full expense of a trial in federal district court.¹⁹⁰ Ordinarily, litigants may appeal only “final decisions” from the district courts.¹⁹¹ Although federal law currently allows for a review of an intermediate matter at trial¹⁹² — a so-called interlocutory appeal — the Federal Circuit has declined to accept such appeals for routine claim interpretation cases.¹⁹³ Both H.R. 1908 and S. 1145 would expressly authorize such interlocutory appeals.¹⁹⁴

Not everyone agrees that routine allowance of interlocutory appeals of claim construction orders would expedite patent litigation. In a letter of June 13, 2007, addressed to Senators Patrick Leahy and Arlen Specter, Federal Circuit Chief Judge Paul Michel stated that should this provision be enacted, “I would expect an interlocutory appeal in virtually every patent infringement case as soon as a claim construction order issues.”¹⁹⁵ In his view, this situation would lead to “extended delays” that “would be intolerable from the standpoint of corporate litigants.”¹⁹⁶

Mandatory Search Reports

Under current law, inventors who file a patent application at the USPTO are required to disclose earlier patents, journal articles, and other prior art references of which they are aware, and that they believe are material to the determination of whether their invention should be patented or not.¹⁹⁷ However, patent applicants are not required affirmatively to conduct a literature search in order to identify relevant prior art references.¹⁹⁸ Although some inventors probably complete a prior art search as a matter of due diligence prior to preparing and filing a patent application, this effort is not obligatory. As part of the prosecution process, USPTO examiners

¹⁹⁸ Schechter & Thomas, *supra*, at § 7.2.1.

conduct literature searches in order to identify the prior art that most closely relates to the claimed invention.

S. 1145 would alter the current rule by requiring that “applicants submit a search report and other information and analysis relevant to patentability.”¹⁹⁹ Applicants that qualify as “micro-entities” — individuals, groups of individuals, small businesses, or non-profit organizations — would be exempt from this requirement. H.R. 1908 is worded similarly, but authorizes the USPTO to impose a search report requirement rather than making such a search mandatory.²⁰⁰

Residency of Federal Circuit Judges

Under current law, each Federal Circuit jurist must “reside within fifty miles of the District of Columbia” while in active service.²⁰¹ S. 1145 proposes to eliminate this requirement.²⁰² No comparable provision appears in H.R. 1908.

Liberalization of the residency requirement would potentially broaden the pool of individuals eligible for service on the Federal Circuit. This reform may also be appropriate for a court that enjoys jurisdiction over patent appeals that arise across the United States.²⁰³ No other federal appellate court is subject to a similar residency requirement.²⁰⁴ On the other hand, because the Federal Circuit courthouse is located in Washington, DC, the current residency rule might promote greater interaction among its jurists.

Inequitable Conduct

The administrative process of obtaining a patent from the USPTO has traditionally been conducted as an *ex parte* procedure. Stated differently, patent prosecution involves only the applicant and the USPTO. Members of the public, and in particular the patent applicant’s marketplace competitors, do not participate in patent acquisition procedures.²⁰⁵ As a result, the patent system relies to a great extent upon applicant observance of a duty of candor and truthfulness towards the USPTO.

An applicant’s obligation to proceed in good faith may be undermined, however, by the great incentive applicants might possess not to disclose, or to misrepresent, information that might deleteriously impact her prospective patent rights. The patent

law therefore penalizes those who stray from honest and forthright dealings with the USPTO. Under the doctrine of “inequitable conduct,” if an applicant intentionally misrepresents a material fact or fails to disclose material information, then the resulting patent will be declared unenforceable.²⁰⁶ Two elements must exist before a court will decide that the applicant has engaged in inequitable conduct. First, the patentee must have misrepresented or failed to disclose material information to the USPTO in the prosecution of the patent.²⁰⁷ Second, such nondisclosure or misrepresentation must have been intentional.²⁰⁸

During patent infringement litigation, an accused infringer has the option of asserting that the plaintiff’s patent is unenforceable because it was procured through inequitable conduct. Concerns have arisen that charges of inequitable conduct have become routine in patent cases. As one commentator explains:

The strategic and technical advantages that the inequitable conduct defense offers the accused infringer make it almost too attractive to ignore. In addition to the potential effect on the outcome of the litigation, injecting the inequitable conduct issue into patent litigation wreaks havoc in the patentee’s camp. The inequitable conduct defense places the patentee on the defensive, subjects the motives and conduct of the patentee’s personnel to intense scrutiny, and provides an avenue for discovery of attorney-client and work product documents²⁰⁹

As the Federal Circuit put it, “the habit of charging inequitable conduct in almost every major patent case has become an absolute plague.”²¹⁰ Other observers believe that because inequitable conduct requires an analysis of the knowledge and intentions of the patent applicants, the doctrine may also be contributing disproportionately to the time and expense of patent litigation.²¹¹

Due to these perceived burdens upon patent litigation, some commentators have proposed that the inequitable conduct defense be eliminated.²¹² Others believe that inequitable conduct is necessary to ensure the proper functioning of the patent system. As the Advisory Commission on Patent Law Reform explained in its 1992 report:

²⁰⁶ *Glaverbel Societe Anonyme v. Northlake Mktg. & Supply Inc.*, 45 F.3d 1550 (Fed. Cir. 1995).

²¹⁰ *Burlington Indus., Inc. v. Dayco Corp.*, 849 F.2d 1418 (Fed. Cir. 1988).

²¹¹ See, e.g., Scott D. Anderson, “Inequitable Conduct: Persistent Problems and Recommended Resolutions,” 82 *Marquette Law Review* (1999), 845.

²¹² Lynch, *supra*, at 7.

Some mechanism to ensure fair dealing between the patentee, public, and the Federal Government has been part of the patent system for over 200 years. In its modern form, the unenforceability defense provides a necessary incentive for patent applicants to engage in fair and open dealing with the [USPTO] during the ex parte prosecution of patent applications, by imposing the penalty of forfeiture of patent rights for failure to so deal. The defense is also considered to be an essential safeguard against truly fraudulent conduct before the [USPTO]. Finally, the defense provides a means for encouraging complete disclosure of information relevant to a particular patent application Thus, from a policy perspective, the defense of unenforceability based upon inequitable conduct is desirable and should be retained.²¹³

Both H.R. 1908 and S. 1145 would for the first time codify the basic parameters of the inequitable conduct, although their approaches somewhat differ. Under H.R. 1908, a holding of inequitable conduct is appropriate only if the patentee, its agents, or another person with a duty of disclosure to the USPTO intentionally misrepresents or fails to disclose material information, such that the USPTO would “have made a *prima facie* finding of unpatentability.”²¹⁴ S. 1145 instead explains that information is considered material if it is not cumulative to evidence already before the examiner, and “a reasonable patent examiner would consider such information important in deciding whether to allow the patent application.”²¹⁵ Both bills set the “clear and convincing evidence” standard for proving that inequitable conduct occurred.

Modification of the Best Mode Requirement

Currently, inventors are required to “set forth the best mode contemplated by the inventor of carrying out his invention.”²¹⁶ Failure to disclose the best mode known to the inventor is a ground for invalidating an issued patent. The courts have established a two-part standard for analyzing whether an inventor disclosed her best mode in a particular patent. The first inquiry was whether the inventor knew of a way of practicing the claimed invention that she considered superior to any other. If so, then the patent instrument must identify, and disclose sufficient information to enable persons of skill in the art to practice that best mode.²¹⁷

Proponents of the best mode requirement have asserted that it allows the public to receive the most advantageous implementation of the technology known to the inventor. This disclosure becomes part of the patent literature and may be freely reviewed by those who wish to design around the patented invention. Absent a best mode requirement, some observers say, patent proprietors may be able to maintain the preferred way of practicing their inventions as a trade secret. Members of the

²¹³ 1992 Advisory Commission, *supra*, at 114.

²¹⁴ H.R. 1908, § 12(b). This language appears similar to that of current USPTO regulations governing inequitable conduct. *See* 37 C.F.R. § 1.56(b).

²¹⁵ S. 1145, § 12. This language appears similar to that of a predecessor version of USPTO regulations governing inequitable conduct, 37 C.F.R. § 1.56(b), prior to their amendment in 1992. *See* *Cargill, Inc. v. Canbra Foods, Ltd.*, 476 F.3d 1359, 1364 (Fed. Cir. 2007).

²¹⁷ *See, e.g., Chemcast Corp. v. Arco Industries Corp.* 913 F.2d 923 (Fed. Cir. 1990).

public are also said to be better able to compete with the patentee on equal footing after the patent expires.²¹⁸

The best mode requirement has encountered severe criticism in recent years, however.²¹⁹ For example, a 1992 Presidential Commission recommended that Congress eliminate the best mode requirement. The Commission reasoned that patents also are statutorily required to disclose “the manner and process of making and using [the invention], in such full, clear, concise, and exact terms as to enable any person skilled in the art ... to make and use the same.”²²⁰ This “enablement” requirement was believed to provide sufficient information to achieve the patent law’s policy goals.²²¹

The Commission further stated that the best mode requirement leads to increases in the costs and complexity of patent litigation. As the Commission explained:

The disturbing rise in the number of best mode challenges over the past 20 years may serve as an indicator that the best mode defense is being used primarily as a procedural tactic. A party currently can assert failure to satisfy the best mode requirement without any significant burden. This assertion also entitles the party to seek discovery on the “subjective beliefs” of the inventors prior to the filing date of the patent application. This broad authority provides ample opportunity for discovery abuse. Given the fluidity by which the requirement is evaluated (e.g., even accidental failure to disclose any superior element, setting, or step can negate the validity of the patent), and the wide ranging opportunities for discovery, it is almost certain that a best mode challenge will survive at least initial judicial scrutiny.²²²

The Commission further reasoned that the best mode at the time of filing is unlikely to remain the best mode when the patent expires many years later.²²³ Because many foreign patent laws include no analog to the best mode requirement, inventors based overseas have also questioned the desirability of the best mode requirement in U.S. law.

Although legislation introduced in the 109th Congress proposed the elimination of the best mode requirement,²²⁴ H.R. 1908 takes a different approach. Under this proposal the best mode requirement continues to apply to all patents, but it no longer forms the basis for a defense to a charge of patent infringement during enforcement

litigation or post-grant review proceedings.²²⁵ Compliance with the best mode requirement would remain subject to review by USPTO examiners during the initial prosecution of a patent, although USPTO rejection of applications based upon failure to comply with the best mode requirement is reportedly a rare circumstance.²²⁶ No analogous provision appears in S. 1145.

USPTO Rulemaking Authority

Under current law, the USPTO enjoys certain rulemaking authority. The USPTO may establish regulations that “govern the conduct of proceedings” before it, for example, as well as regulations that “govern the recognition and conduct” of patent attorneys.²²⁷ Both H.R. 1908 and S. 1145 further address USPTO rulemaking authority.

S. 1145 proposes that the USPTO be granted the authority “to set or adjust by rule any fee established or charged by the Office” under certain provisions of the patent and trademark laws.²²⁸ This proposal appears to provide the USPTO with greater flexibility to adjust its fee schedule absent congressional intervention.

In contrast, under H.R. 1908, the USPTO Director would be allowed to “promulgate regulations to ensure the quality and timeliness of applications and their examination, including specifying circumstances under which an application for patent may claim the benefit under sections 120, 121 and 365(c) of the filing date of a prior filed application for patent.”²²⁹ H.R. 1908 further stipulates that this amendment “clarifies the scope of power granted to the [USPTO]” under existing law.²³⁰

The language of the House bill appears to be motivated at least in part by current USPTO efforts to limit the availability of so-called continuation applications via regulation. Continuation applications essentially allow inventors to re-file previously rejected patent applications in order to pursue further prosecution with a USPTO examiner.²³¹ The filing of a patent application effectively allows two formal communications, termed “Office Actions,” with a USPTO examiner. Agreement often cannot be reached by this point, however, leaving the applicant with only the alternatives of abandonment of patent protection or the filing of an appeal. By filing

²²⁵ H.R. 1908, § 13.

²³⁰ *Ibid.* at § 12(b).

²³¹ 35 U.S.C. § 120.

a continuation application, an applicant essentially purchases additional time for dialogue between the applicant and examiner.

The use of continuation applications is commonplace in U.S. patent practice. Applicants not infrequently file one or more continuing applications based upon an earlier filed “patent” application. Many patents have issued based upon chains of continuation applications involving a parent, grandparent, and even more remote predecessors.

Continuation applications are said to allow applicants to more accurately claim a previously disclosed invention without the necessity of an appeal.²³² Some commentators believe they are subject to abuse, however. Under this view, continuation practice introduces delay and uncertainty into the patent acquisition process. In particular, applicants are said to use a chain of continuation applications in order to gain advantages over competitors by waiting to see what product the competitor will make, and then drafting patent claims that cover that product. Continuation practice is also said to have led to long delays in the issuance of a patent in order to surprise an established industry, a process known as “submarine patenting.”²³³

The USPTO recently promulgated rules that would limit the number of continuation applications that an applicant could file as a matter of right. Beyond this limit, further continuation applications could only be filed upon a particular showing of need.²³⁴ Criticisms of these rules resulted in legal challenges before the U.S. District Court for the Eastern District of Virginia. The result was the October 31, 2007, order in *Tafas v. Dudas*, that issued a preliminary injunction against the USPTO.²³⁵ Although this ruling is temporary in nature, its immediate impact is that the USPTO may not implement its rules until the court makes a final determination. The *Tafas v. Dudas* litigation is ongoing at the time of the publication of this report.

Late USPTO Filings

S. 1145 would also allow the USPTO Director to accept filings in patent and trademark matters made after the applicable statutory deadline, provided that the tardy applicant “files a petition within 30 days after such deadline showing, to the satisfaction of the Director, that the delay was unintentional.”²³⁶ Both the patent and trademark statutes require the individual to complete certain filings by specified time

²³⁵ The district court’s opinion resulted from two separate lawsuits, *Tafas v. Dudas*, Case No. 1:07cv846 (E.D. Va.), and *Smithkline Beecham Corp. v. Dudas*, Case No. 1:07cv1008 (E.D. Va.), that were consolidated.

²³⁶ S. 1145, § 13.

limits in order to obtain intellectual property rights, object to rights granted to others, or for other reasons.²³⁷ These statutes often, but not always, provide for USPTO acceptance of late filings upon a special showing by the applicant.²³⁸ S. 1145 appears to provide a general statutory provision for late filings that would supplement the current, more narrowly targeted provisions. No analogous provision appears in H.R. 1908.

Check Imaging Methods

S. 1145 proposes to limit the remedies available for patent infringement with respect to a “financial institution” that uses a “check collection system.”²³⁹ In particular, in such circumstances the patentee may not commence a civil action against the financial institution, and is not eligible to receive damages, attorney fees, or an injunction. No comparable provision appears in H.R. 1908.

USPTO Funding

Section 15 of S. 1145 would address the collection of fees by the USPTO, as well as the disposition of such fees. USPTO funding largely derives from the fees it charges to patent and trademark applicants, as well as other entities that interact with the agency.²⁴⁰ Since 1990, however, Congress has not allocated all of the fees that the USPTO has collected towards the operation of that agency. Reportedly over \$750 million in USPTO fees have been directed towards other government operations.²⁴¹

Congress has expressed interest in the controversial issue of USPTO fee diversion for several years. In the 109th Congress, legislation introduced before both the House and Senate would have addressed USPTO fee diversion.²⁴² S. 1145 would establish a “USPTO Revolving Fund” consisting of fees deposited with the USPTO. The amount deposited in the fund would in turn be available for the USPTO to spend in support of that agency’s operations. The USPTO would be responsible for notifying the House and Senate Appropriation Committees of its funds and expenditures.²⁴³

²³⁷ See, e.g., 35 U.S.C. § 133 (stating time limits for prosecuting a patent application).

²³⁸ See, e.g., 35 U.S.C. § 156(d)(1) (stating a 60-day filing period with no exceptions).

²³⁹ S. 1145, § 14.

²⁴² See S. 1020, H.R. 2791.

²⁴³ S. 1145, § 15.

Concluding Observations

Pending legislation introduced in the 110th Congress arguably would work the most sweeping reforms to the U.S. patent system since the nineteenth century. However, many of these proposals, such as pre-issuance publication, prior user rights, and oppositions, have already been implemented in U.S. law to a more limited extent. These and other proposed modifications, such as the first-inventor-to-file priority system and elimination of the best mode requirement, also reflect the decades-old patent practices of Europe, Japan, and our other leading trading partners. As well, many of these suggested changes enjoy the support of diverse institutions, including the Federal Trade Commission, National Academies, economists, industry representatives, attorneys, and legal academics.

Other knowledgeable observers are nonetheless concerned that certain of these proposals would weaken the patent right, thereby diminishing needed incentives for innovation. Some also believe that changes of this magnitude, occurring at the same time, do not present the most prudent course for the patent system. Patent reform therefore confronts Congress with difficult legal, practical, and policy issues, but also with the apparent possibility for altering and potentially improving the legal regime that has long been recognized as an engine of innovation within the U.S. economy.

Legislation

H.R. 1908 (Berman)

Patent Reform Act of 2007. Makes changes to patent law. Introduced April 18, 2007; referred to the House Committee on the Judiciary. Hearings held by the Subcommittee on Courts, the Internet, and Intellectual Property on April 26, 2007. Ordered reported, amended, from Committee on July 18, 2007. Reported on September 4, 2007, and passed the House on September 7, 2007.

S. 1145 (Leahy)

Patent Reform Act of 2007. Makes changes to patent law. Introduced April 18, 2007; referred to the Senate Committee on the Judiciary. Hearings held June 6, 2007. Ordered reported, amended, from Committee on July 19, 2007. crsphpgw
