

CRS Report for Congress

Iraqi Civilian Casualties Estimates

Hannah Fischer
Information Research Specialist
Knowledge Services Group

Summary

This report presents various governmental and nongovernmental estimates of Iraqi civilian dead and wounded. The Department of Defense (DOD) regularly updates total U.S. military death and wounded statistics from Operation Iraqi Freedom (OIF), as reflected in CRS Report RS21578, *Iraq: Summary of U.S. Casualties*. However, no Iraqi or U.S. government office regularly releases publically available statistics on Iraqi civilian deaths or civilians who have been wounded. Statistics on Iraqi civilian dead and wounded are sometimes available through alternative sources, such as nonprofit organizations, or through statements made by officials to the press. Because these estimates are based on varying time periods and have been created using differing methodologies, readers should exercise caution when using these statistics and should look on them as guideposts rather than as statements of fact. See also CRS Report RS22532, *Iraqi Police and Security Forces Deaths Estimates*. This report will be updated as needed.

Total or Annual Estimates of Iraqi Civilian Deaths

The Department of Defense (DOD) has not released a composite estimate of Iraqi civilian deaths during Operation Iraqi Freedom, though in the report *Measuring Stability and Security in Iraq*, it has released a chart containing two separate estimates of Iraqi civilian deaths from January 2006 to February 2008.¹ The first estimate is derived from coalition and Iraqi reports of civilian deaths, whereas the second estimate is derived from the Iraq Significant Activities (SIGACTS) III database, which includes coalition reports only. The DOD noted in the December 2007 update of *Measuring Stability and Security in Iraq* that “host nation reports capture some types of deaths on which the Coalition does not have visibility, in particular, murders and deaths in locations where Coalition forces

are not present.”² In addition to using *Measuring Stability and Security in Iraq*, we have also used an approximation of the updated casualty estimates for March 2008 used by General David. H. Petraeus in his April 2008 testimony to Congress.

While the chart provides a guideline to Iraqi civilian deaths trends, the data behind the chart has not been released. Using estimates, CRS has reproduced an approximation of the DOD’s chart in the figure below.

Figure 1. Iraqi Civilian Deaths, January 2006 - March 2008

Multi-National Corps - Iraq Strategic Plans Assessments Iraq Significant Activities (SIGACTS) III database (Coalition Reports Only) and (Coalition and Iraqi Reports) as of February 23, 2008. (End of the month February 2008 projected.)

For some time, the United Nations attempted to release comprehensive statistics on Iraqi civilian deaths. From August 2005 to March 2007, the United Nations Assistance Mission for Iraq (UNAMI) released a series of quarterly reports on human rights in Iraq that included sections on Iraqi civilian casualties. On April 25, 2007, however, the Iraqi government announced its intention to cease providing civilian casualty figures to the United Nations.³ Ivana Vuco, a UN human rights officer, stated, “[Iraqi] government officials had made clear during discussions that they believed releasing high casualty numbers would make it more difficult to quell unrest.”⁴ The most recent UNAMI report on human rights, released on October 11, 2007, and concerning the period between April - June 2007, expressed regret that “for this reporting period, [UNAMI] was again unable

to persuade the Government of Iraq to release data on casualties compiled by the Ministry of Health and its other institutions. UNAMI continues to maintain that making such data public is in the public interest.”⁵

In a recent interview with the *Boston Globe*, Rear Admiral Gregory Smith, the chief U.S. military spokesman, confirmed Iraqi ministry civilian death tolls estimates that have risen from a low of 568 in December 2007 and 541 in January 2008 to roughly 721 in February 2008 and 1,082 in March 2008.⁶ “There was somewhere on the order of a 25 or 30 percent increase in the number of civilian casualties when you consider March compared to February,” Smith said, although “the numbers are still nowhere near what they had been last summer.”⁷ Reuters reports that the Iraqi Health Ministry figures showed 968 civilian deaths in April 2008 and that two hospitals in Sadr City have received 421 bodies, many of which have been civilians, since late March.⁸

Table 1. Annual or Total Iraqi Civilian Deaths Estimates

Iraq Body Count March 19, 2003 - May 2, 2008	83,221 - 90,782
Iraq Coalition Casualty Count April 28, 2005 - May 2, 2008	41,962
Brookings Iraq Index May 2003 - March 2008	104,317
The Associated Press April 2005 - February 13, 2008	31,245 dead 35,436 wounded
The Iraq Family Health Study (the “WHO study”) March 2003 - June 2006	151,000
<i>The Lancet</i> , “Mortality after the 2003 Invasion of Iraq” March 19, 2003 - July 31, 2006	426,369 - 793,663

Three cluster studies of violence-related mortality in Iraq have recently been undertaken. The first two studies were both conducted by researchers from Johns Hopkins University and Baghdad’s Al-Mustansiriya University and are commonly referred to in the press as “the *Lancet* studies” because they were published in the British medical journal of that name. The third study was conducted by a consortium of researchers, many of whom are associated with the World Health Organization, and so the study is commonly referred to as “the WHO study” in the press.

The first of these studies, published in 2004, used a cluster sample survey of households in Iraq to develop an estimate ranging from 8,000 to 194,000 civilian casualties due to violent deaths since the start of the war.⁹ This report has come under some criticism for its methodology, which may not have accounted for the long-term negative health effects of the Saddam Hussein era. Former British Foreign Minister Jack Straw has written a formal Ministerial Response rejecting the findings of the first *Lancet* report on the grounds that the data analyzed were inaccurate.¹⁰

The second study, published in 2006, increased the number of clusters surveyed from 33 to 47 and reported an estimate of between 426,369 and 793,663 Iraqi civilian deaths from violent causes since the beginning of Operation Iraqi Freedom.¹¹ This article, too, has sparked some controversy.¹² Stephen Moore, a consultant for Gorton Moore International, objected to the methods used by the researchers, commenting in the *Wall Street Journal* that the *Lancet* article lacked some of the hallmarks of good research: a small margin of error, a record of the demographics of respondents (so that one can be sure one has captured a fair representation of an entire population), and a large number of cluster points.¹³ However, documents written by the UK Ministry of Defence's chief scientific advisor have come to light, which called the survey's methods "close to best practice" and "robust."¹⁴

In the third and most recent study, a team of investigators from the Federal Ministry of Health in Baghdad, the Kurdistan Ministry of Planning, the Kurdistan Ministry of Health, the Central Organization for Statistics and Information Technology in Baghdad, and the World Health Organization formed the Iraq Family Health Survey (IFHS) Study Group to research violence-related mortality in Iraq.¹⁵ In their nationally representative cluster study, interviewers visited 89.4% of 1086 household clusters; the household response rate was 96.2%. They concluded that there had been an estimated 151,000 violence-related deaths from March 2003 through June 2006 and that violence was the main cause of death for men between the ages of 15 and 59 years during the first three years after the 2003 invasion. This study seems now to be widely cited for violence-related mortality rates in Iraq. Neither the *Lancet* studies nor the IFHS study make an

effort to distinguish different victims of violence, such as civilians versus police or security force members.

The Associated Press has also kept a database of Iraqi civilian and security forces dead and wounded since April 2005. According to the AP database, between April 2005 and February 13, 2008, 31,245 Iraqi civilians have died and another 35,436 have been wounded.¹⁶

A number of nonprofit groups have released unofficial estimates of Iraqi civilian deaths. The Iraq Body Count (IBC) is one source often cited by the media; it bases its online casualty estimates on media reports of casualties, some of which may involve security forces as well as civilians. As of March 10, 2007, the IBC estimated that between 83,221 and 90,782 civilians had died as a result of military action.¹⁷ The IBC documents each of the casualties it records with a media source and provides a minimum and a maximum estimate.

The Brookings Institution has used modified numbers from the UN *Human Rights Report*, the Iraq Body Count, General Petraeus's congressional testimony given on September 10-11, 2007, and other sources to develop its own composite estimate for Iraqi civilians who have died by violence. By combining all of these sources by date, Brookings Institution estimates that between May 2003 and February 2008, 104,317 Iraqi civilians have died.¹⁸

Finally, the Iraq Coalition Casualty Count (ICCC) is another well-known non-profit that tracks Iraqi civilian and Iraqi security forces deaths using an IBC-like method of posting media reports of deaths. ICCC, like IBC, is prone to the kind of errors likely when using media reports for data: some deaths may not be reported in the media, while other deaths may be reported more than once. The ICCC does have one rare feature: it separates police and soldier deaths from civilian deaths. The ICCC estimates that there were 41,962 civilian deaths from April 28, 2005 through March 10, 2008.¹⁹
