## Summary

Petroleum prices rose sharply in the first half of 2008, at one time reaching more than \$140 per barrel of crude oil. Since July, however, petroleum prices and import volumes have fallen at a historically rapid pace; in January 2009, prices of crude oil fell below \$40 per barrel. At the same time the average monthly volume of imports of energy-related petroleum products fell slightly. The sharp rise in the cost of energy imports added an estimated \$28 billion to the nation's trade deficit in 2007 and \$120 billion in 2008. The fall in the cost of energy imports combined with the drop in import volumes as a result of the slowdown in economic activity reversed the trend of rising energy imports costs and sharply reduced the overall costs of U.S. energy imports for 2008 and for the first month of 2009. This report provides an estimate of the initial impact of the changing oil prices on the nation's merchandise trade deficit. This report will be updated as warranted by events.

## Background

According to data published by the Census Bureau of the Department of Commerce,<sup>1</sup> the prices of petroleum products over the first half of 2008 rose sharply, generally rising considerably faster than the change in demand for those products, before falling at a historic rate. As a result, the price changes in imported energy-related petroleum products worsened the U.S. trade deficit in 2006, 2007, and 2008. Energy-related petroleum products is a term used by the Census Bureau that includes crude oil, petroleum preparations, and liquefied propane and butane gas. Crude oil comprises the largest share by far within this broad category of energy-related imports. The slowdown in the rate of growth in the U.S. economy is sharply reducing the amount of energy the country imports and is helping to push down world energy prices. In isolation from other events, lower energy prices tend to aid the U.S. economy, which makes it a more attractive destination for foreign investment. Such capital inflows place upward pressure on the dollar against a broad range of other currencies. To the extent that the additions to the merchandise trade deficit are returned to the U.S. economy as payment for additional U.S. exports or to acquire such assets as securities or U.S. businesses, the U.S. trade deficit could be mitigated further.

**Table 1** presents summary data from the Census Bureau for the change in the volume, or quantity, of energy-related petroleum imports and the change in the price, or the value, of those imports for 2008 and for 2009. The data indicate that the United States imported 4.6 billion barrels of total energy-related petroleum products in 2008, valued at \$439 billion, compared with a total value of \$319 billion in 2007. In 2008, the quantity of energy-related petroleum imports fell by 4.0% compared with the comparable period in 2007; crude oil imports also fell by 2.7% from the same period in 2007. Year-over-year, the average value of energy-related petroleum products imports rose by 37.6%, while the average value of crude oil imports rose by 44.2%. As **Figure 1** shows, imports of energy-related petroleum products can vary sharply on a monthly basis, but averaged about 384 million barrels a month in 2008.

**Note:** Estimates for January through December 2009 were developed by CRS from data through February 2009 and data through 2008 published by the Census Bureau using a straight line extrapolation.

**Figure I. Quantity of U.S. Imports of Energy-Related Petroleum Products**

**Source:** Department of Commerce

In value terms, energy-related imports rose from \$319 billion in 2007 to \$439 billion in 2008, or an increase of 38%, to account for about 22% of the value of total U.S. merchandise imports. In 2008, the sharp rise experienced in energy prices in 2007 continued in January through July 2008 and did not follow previous trends of falling during the winter months. As **Figure 2** shows, the cost of U.S. imports of energy-related petroleum products rose from about \$17 billion per month in early 2007 to \$53 billion a month in July 2008, but fell to \$13.6 billion in February 2009, reflecting a drop in the price and in the volume of imported oil. The average price of imported oil

in February 2009 was down 54% from the average price in February 2008, and down 69% from the average price in July 2008, reflecting the sharp decrease in the price of imported oil in August 2008 through February, 2009, as indicated in **Figure 2**.

**Figure 2. Value of U.S. Imports of Energy-Related Petroleum Products**

Source: Department of Commerce

As a result of the overall rise in the value of energy-related imports in 2008, the trade deficit in energy-related imports amounted to \$386 billion, or 47% of the total U.S. trade deficit of \$821 billion for the year. In January-February 2009, the drop in oil prices combined with reduced demand for energy imports to push down the overall value of energy imports, which dropped to account for 37% of the total merchandise trade deficit. This share is up slightly from January 2009 due to a slight increase in the petroleum-related share of the trade deficit as a result of a drop in the overall trade deficit in non-petroleum goods. Based on data for the January-February 2009 period, the energy-related trade deficit in 2009 could fall by half from the deficit in 2008.

a. Energy-related petroleum products is a term used by the Census Bureau and includes crude oil, petroleum preparations, and liquefied propane and butane gas.

Crude oil comprises the largest share of energy-related petroleum products imports. According to Census Bureau data<sup>2</sup> as shown in **Table 2**, imports of crude oil fell from an average of 10.11 million barrels of crude oil imports per day in 2007 to an average of 9.8 million barrels per day in 2008, or a decrease of 3%. In December 2008, such imports averaged 10.3 million barrels per day, or an increase of 7.4% over the volume of such imports recorded in December 2007. From June 2007 to June 2008, the average price of crude oil increased from \$61 per barrel to \$117 per barrel, or an increase of 92%, as shown in **Figure 3**. As a result, the value of U.S. crude oil imports rose from about \$19 billion a month in June 2007 to \$35 billion a month in June 2008.

**Figure 3. U.S. Import Price of Crude Oil**

Source: Department of Commerce

Data for 2008 indicate that a number of factors combined to push oil prices to record levels in July 2008, before tumbling quickly. The sharp rise in oil prices combined with a small decrease in the volumes of oil imports experienced during the period to post a large jump in the overall cost of imported energy. At times, crude oil traded for nearly \$148 per barrel in July 2008, indicating that the cost of energy imports would have a significant impact on the overall costs of U.S. imports and on the value of the U.S. trade deficit. Since those record prices, the price per barrel of imported crude oil fell to under \$40 per barrel at times in January and February 2009. For the year 2008, the imported volume of energy-related petroleum products fell by 4.0%, due in large part to a slowdown in economic activity. At an average price of \$95 per barrel, compared with an average price of \$64 per barrel in 2007, energy-related import prices added nearly \$100 billion to the trade deficit on an annual basis in 2008, pushing the annual trade deficit to just over \$820 billion.

<sup>2</sup> Report FT900, U.S. International Trade in Goods and Services, April 9, 2009. Table 17.

## Issues for Congress

The sharp rise in prices of energy imports experienced since early 2007 through July 2008 was expected to affect the U.S. rate of inflation and have a slightly negative impact on the rate of economic growth in 2008. Various factors, dominated by the sharp slowdown in the rate of economic growth in the United States and most other areas of the world, are combining to push down the cost of energy imports. Typically, energy import prices have followed a cyclical pattern that has caused energy prices to decline in the winter. A slowdown in the rate of economic growth in the United States and elsewhere is reducing the demand for energy imports and caused oil prices to tumble from the heights they reached in July 2008. An important factor that often affects crude oil prices is the impact Atlantic hurricanes have on the production of crude oil in the Gulf of Mexico. The drop in oil prices likely will lessen the nation's merchandise trade deficit, although the most important factor affecting the trade deficit throughout 2009 will be the rate of growth in the U.S. economy.

Over the long run, a return to a positive rate of economic growth likely will place upward pressure on the prices of energy imports that will increase the nation's merchandise trade deficit. Some of this impact could be offset if some of the dollars are returned to the U.S. economy through increased purchases of U.S. goods and services or through purchases of such other assets as corporate securities or acquisitions of U.S. businesses. Some of the return in dollars likely will come through sovereign wealth funds (SWFs), or funds controlled and managed by foreign governments, as foreign exchange reserves boost the dollar holdings of such funds. Such investments likely will add to concerns about the national security implications of foreign acquisitions of U.S. firms, especially by foreign governments, and to concerns about the growing share of outstanding U.S. Treasury securities that are owned by foreigners.

It is likely that the economy will again face high and rising prices for imported energy products as national economies recover to a more robust rate of economic growth. It is possible for the economy to adjust to the higher prices of energy imports by improving its energy efficiency, finding alternative sources of energy, or searching out additional supplies of energy. There may well be increased pressure applied to Congress to assist in this process. For Congress, the increase in the nation's merchandise trade deficit could add to existing inflationary pressures and complicate efforts to stimulate the economy should the rate of economic growth slow down. In particular, Congress, through its direct role in making economic policy and its oversight role over the Federal Reserve, could face the dilemma of rising inflation, which generally is treated by raising interest rates to tighten credit, and a slowing rate of economic growth, which is usually addressed by lowering interest rates to stimulate investment. A sharp rise in the trade deficit may also add to pressures for Congress to examine the causes of the deficit and to address the underlying factors that are generating that deficit. In addition, the rise in prices of energy imports could add to concerns about the nation's reliance on foreign supplies for energy imports and add impetus to examining the nation's energy strategy.
