## Summary

Social Security auxiliary benefits are paid to the spouse, former spouse, survivor, child, or parent of a Social Security-covered worker and are equal to a specified percentage of the worker's basic monthly benefit amount (subject to a maximum family benefit amount). For example, the spouse of a retired worker may receive up to 50% of the retired worker's basic benefit and the widow(er) of a retired worker may receive up to 100% of the retired worker's basic benefit.

When auxiliary benefits were first established, most households consisted of a single earner—usually the husband—and a wife who cared for children and remained out of the paid workforce. As a result, benefits for nonworking spouses were structured to be relatively generous. A woman who was never employed but is married to a man with high Social Security-covered wages may receive a Social Security spousal benefit that is higher than the retirement benefit received by a single woman, or a divorced woman who was married less than 10 years, who worked a full career in a low-wage job.

In recent decades, this household structure has changed in part because women have entered the workforce in increasing numbers. The labor force participation rate of women with children under the age of 18 increased from 47% in 1975 to 70.8% in March 2016. As a result, many women now qualify for Social Security benefits based on their own work records. Women are, however, more likely than men to take breaks in employment to care for family members, which can result in fewer years of contributions to Social Security and employer-sponsored pension plans.

Beneficiaries who qualify for multiple benefits do not receive both benefits in full, however. For example, for a beneficiary eligible for his or her own retired-worker benefits as well as spousal benefits, the spousal benefit is reduced by the amount of the retired-worker benefit. The beneficiary receives a reduced spousal benefit (if not reduced to zero) in addition to his or her retired-worker benefit. This effectively means the beneficiary receives the higher of the two benefit amounts. Because of this, a two-earner household may receive lower total Social Security benefits than a single-earner household with identical total Social Security-covered earnings.

Another change since 1939 has been an increase in the number of men and women who remain single or who have divorced. Persons who have never been married, or divorced before 10 years of marriage, do not qualify for Social Security spousal or survivors benefits under current law.

Proposals to modify the Social Security auxiliary benefit structure are often motivated by desire to improve adequacy for certain beneficiaries, or equity between a two-earner household and a one-earner household with similar earning profiles. For example, some proposals address the adequacy of benefits for certain groups of beneficiaries, such as elderly and widowed women. Although Social Security plays an important role in the retirement security of aged women, about 13.9% of widowed women aged 65 or older, 15.8% of divorced elderly women, and 21.5% of never-married elderly women have family incomes below the official poverty line in 2017.

## Introduction

Social Security provides *dependent benefits* and *survivors benefits*, sometimes collectively referred to as *auxiliary benefits*, to the spouses, former spouses, widow(er)s, children, and parents of retired, disabled, or deceased workers.<sup>1</sup> Auxiliary benefits are based on the work record of the household's primary earner.

Social Security spousal benefits (i.e., benefits for a wife or husband of the primary earner) are payable to the spouse or divorced spouse of a retired or disabled worker. Social Security survivors benefits are payable to the survivors of a deceased worker as a widow(er), as a child, as a mother or father of the deceased worker's child(ren), or as a dependent parent of the deceased worker. Although Social Security is often viewed as a program that primarily provides benefits to retired or disabled workers, 33% of new benefit awards in 2017 were made to the dependents and survivors of retired, disabled, and deceased workers.<sup>2</sup>

Spousal and survivors benefits play an important role in ensuring women's retirement security. However, women continue to be vulnerable to poverty in old age, due to demographic and economic reasons. This report presents the current-law structure of auxiliary benefits for spouses, divorced spouses, and surviving spouses. It makes note of adequacy and equity concerns of current-law spousal and widow(er)'s benefits, particularly with respect to female beneficiaries, and discusses the role of demographics, the labor market, and current-law provisions on adequacy and equity. The report concludes with a discussion of proposed changes to spousal and widow(er) benefits to address these concerns.

## Origins of Social Security Auxiliary Benefits

The original Social Security Act of 1935 (P.L. 74-271) established a system of Old-Age Insurance to provide benefits to individuals aged 65 or older who had "earned" retirement benefits through work in jobs covered by the system. Before the Old-Age Insurance program was in full operation, the Social Security Amendments of 1939 (P.L. 76-379) extended monthly benefits to workers' dependents and survivors. The program now provided Old-Age and Survivors Insurance (OASI).<sup>3</sup>

The 1939 amendments established benefits for the following dependents and survivors: (1) a wife aged 65 or older; (2) a child under the age of 18; (3) a widowed mother of any age caring for an eligible child; (4) a widow aged 65 or older; and (5) a surviving dependent parent aged 65 or older.

In its report to the Social Security Board (the predecessor to the Social Security Administration) and the Senate Committee on Finance, the 1938 Social Security Advisory Council justified creating spousal benefits on the grounds of the adequacy of household benefits:

The inadequacy of the benefits payable during the early years of the old-age insurance program is more marked where the benefits must support not only the annuitant himself but also his wife. In 1930, 63.8 per cent of men aged 65 and over were married. Payment of supplementary allowances to annuitants who have wives over 65 will increase the

<sup>1</sup> As a result of the Supreme Court's decision in *Obergefell v. Hodges*, the Social Security Administration is now able to recognize same-sex marriages and certain nonmarital legal relationships in all states, territories, and the District of Columbia.

<sup>2</sup> Social Security Administration, *Fast Facts & Figures About Social Security, 2018*, p. 13, [https://www.ssa.gov/policy/docs/chartbooks/fast\\_facts/2018/fast\\_facts18.pdf](https://www.ssa.gov/policy/docs/chartbooks/fast_facts/2018/fast_facts18.pdf).

<sup>3</sup> Congress later established the Disability Insurance (DI) program in 1956.

average benefit in such a manner as to meet the greatest social need with the minimum increase in cost. The Council believes that an additional 50 percent of the basic annuity would constitute a reasonable provision for the support of the annuitant's wife.<sup>4</sup>

The Social Security Board concurred in its own report, which it wrote based on the council's report. The board also found that benefit adequacy was the primary justification for spousal benefits:

The Board suggests that a supplementary benefit be paid for the aged dependent wife of the retired worker which would be related to his old-age benefit. Such a plan would take account of greater presumptive need of the married couple without requiring investigation of individual need.<sup>5</sup>

Since 1939, auxiliary benefits have been modified by Congress many times, including the expansion of benefits to husbands, widowers, and divorced spouses.<sup>6</sup> The legislative history of auxiliary benefits is outlined in detail in **Appendix A**.

## Auxiliary Benefits

Auxiliary benefits for a spouse, survivor, or other dependent are based on the benefit amount received by a primary earner (an insured worker). The primary earner may receive a Social Security retirement or disability benefit. Social Security retirement benefits are based on the average of a worker's highest 35 years of earnings (less up to 5 years for years of disability) from covered employment. A worker's basic benefit amount (*primary insurance amount* or PIA) is computed by applying the Social Security benefit formula to the worker's career-average, wage-indexed monthly earnings (*average indexed monthly earnings* or AIME).<sup>7</sup> The benefit formula replaces a higher percentage of the preretirement earnings of workers with low career-average earnings than for workers with high career-average earnings.

The primary earner's initial monthly benefit is equal to his or her PIA if benefits are claimed at *full retirement age* (FRA, which ranges from age 65 to age 67, depending on year of birth). A worker's initial monthly benefit will be less than his or her PIA if the worker begins receiving benefits before FRA, and it will be greater than his or her PIA if the worker begins receiving benefits after FRA. The purpose of the actuarial adjustment to benefits claimed before or after FRA is to ensure that the worker receives roughly the same total lifetime benefits regardless of when he or she claims benefits (assuming he or she lives to average life expectancy).

Auxiliary benefits are paid to the spouse, former spouse, survivor, child, or parent of the primary earner.<sup>8</sup> Auxiliary benefits are determined as a percentage of the primary earner's PIA, subject to

<sup>4</sup> U.S. Congress, Senate Committee on Finance, *Advisory Council on Social Security: Final Report*, committee print, 76<sup>th</sup> Cong., 1<sup>st</sup> sess., December 10, 1938, S. Prt. 76-4 (Washington: GPO, 1939), p. 15, <https://www.finance.senate.gov/imo/media/doc/76PrtAdvisoryCouncil.pdf>.

<sup>5</sup> Social Security Board, *A Report to the President and to the Congress of the United States*, December 30, 1938, <http://www.socialsecurity.gov/history/reports/38ssbadvise.html>.

<sup>6</sup> Court decisions have led to changes in interpretation or implementation of existing provisions of law. See an example in footnote 1.

<sup>7</sup> Years of earnings are indexed up to the second calendar year before the year of earliest eligibility (i.e., the year in which the worker first attains age 62, becomes disabled, or dies). Years of earnings after the last indexing year are counted in nominal (i.e., unadjusted) dollars. For more information of Social Security benefit computation, see CRS Report R43542, *How Social Security Benefits Are Computed: In Brief*.

<sup>8</sup> Benefits for the dependent children and parents of an insured worker are not discussed in this report. For a brief background on those benefits, see "Benefits for Children," <https://www.ssa.gov/pubs/EN-05-10085.pdf>, and "Parent's

a maximum family benefit amount. For example, the spouse of a retired or disabled worker may receive up to 50% of the worker's PIA, and the widow(er) of a deceased worker may receive up to 100% of the worker's PIA. As with benefits paid to the primary earner, auxiliary benefits are subject to adjustments based on age at entitlement and other factors. A basic description of auxiliary benefits is provided in the following sections, with more detailed information provided in **Appendix B**.

## Currently Married or Separated Spouses

Social Security provides a spousal benefit that is equal to 50% of a retired or disabled worker's PIA.<sup>9</sup> A qualifying spouse must be at least 62 years old or have a qualifying child (a child who is under the age of 16 or who receives Social Security disability benefits) in his or her care. A qualifying spouse may be either married to or separated from the worker. An individual must have been married to the worker for at least one year before he or she applies for spousal benefits, with certain exceptions. In addition, the worker must be entitled to (generally, collecting) benefits in order for an eligible spouse to become entitled to benefits.<sup>10</sup>

If a spouse claims benefits before FRA, his or her benefits are reduced to take into account the longer expected period of benefit receipt. An individual who is entitled to a Social Security benefit based on his or her own work record and to a spousal benefit in effect receives the higher of the two benefits (see "Dually Entitled Beneficiaries" below).

## Widows and Widowers

Under current law, surviving spouses (including divorced surviving spouses) may be eligible for aged widow(er) benefits beginning at the age of 60. If the surviving spouse has a qualifying disability and meets certain other conditions, survivors benefits are available beginning at the age of 50. The aged widow(er)'s basic benefit is equal to 100% of the deceased worker's PIA.

A qualifying widow(er) must have been married to the deceased worker for at least nine months and must not have remarried before the age of 60 (or before age 50 if the widow[er] is disabled).<sup>11</sup> Widow(er)s who remarry after the age of 60 (or after age 50 if disabled) may become entitled to benefits based on the prior deceased spouse's work record. Widow(er)s who are caring for children under the age of 16 or disabled may receive survivors benefits at any age and do not have to meet the length of marriage requirement—see "Mothers and Fathers" below.

If an aged widow(er) claims survivors benefits before FRA, his or her monthly benefit is reduced (up to a maximum of 28.5%) to take into account the longer expected period of benefit receipt. In addition, survivors benefits may be affected by the deceased worker's decision to claim benefits before FRA under the *widow(er)'s limit provision* (see **Appendix B**). As with spouses of retired or disabled workers, a surviving spouse who is entitled to a Social Security benefit based on his or her own work record and a widow(er)'s benefit receives in effect the higher of the two benefits (see "Dually Entitled Beneficiaries" below).

---

Benefits," <https://www.ssa.gov/pubs/EN-05-10036.pdf>.

<sup>9</sup> As noted above, a retired worker's own monthly benefit may be higher or lower than his or her PIA. A disabled worker's benefit is equal to his or her PIA. A retired or disabled worker's monthly benefit may be subsequently adjusted for earnings derived while in receipt of benefits, certain offsets, or other reasons.

<sup>10</sup> As discussed below, different rules may apply in the case of a divorced spouse.

<sup>11</sup> Exceptions are provided in some cases such as accidental death or death in the line of duty.

## Mothers and Fathers

Social Security provides benefits to a surviving spouse or divorced surviving spouse of any age who is caring for the deceased worker's child, when that child is either under the age of 16 or disabled. Mother's and father's benefits are equal to 75% of the deceased worker's PIA, subject to a maximum family benefit. There are no length of marriage requirements for mother's and father's benefits, whether the beneficiary was married to, separated from, or divorced from the deceased worker; however, remarriage generally ends entitlement to mother's and father's benefits.

## Divorced Spouses

Spousal benefits are available to a divorced spouse beginning at the age of 62, if the marriage lasted at least 10 years before the divorce became final and the person claiming spousal benefits is currently unmarried.<sup>12</sup> A divorced spouse who is younger than 62 years old is not eligible for spousal benefits even with an entitled child in his or her care. Survivors benefits are available to a divorced surviving spouse beginning at the age of 60 (or beginning at age 50 if the divorced surviving spouse is disabled) if the divorced surviving spouse has not remarried before the age of 60 (or before age 50 if disabled), or if the surviving divorced spouse has an entitled child in his or her care.

Divorced spouses who are entitled to benefits receive the same spousal and survivors benefits as married or separated persons. If a divorced spouse claims benefits before FRA, his or her benefits are reduced to take into account the longer expected period of benefit receipt. In addition, a divorced spouse who is entitled to a Social Security benefit based on his or her own work record and a spousal or survivor benefit receives in effect the higher of the two benefits (see "Dually Entitled Beneficiaries" below).

## Data on Duration of Marriages

A divorced person who was married to a primary earner for less than 10 years does not qualify for spousal benefits on that spouse's record (although he or she may qualify for benefits based on his or her own record or on another spouse's record).<sup>13</sup> First marriages that end in divorce have a median duration of 8 to 12 years.<sup>14</sup> **Table 1** shows that the proportions of males and females who

<sup>12</sup> As noted previously, generally the worker must have claimed benefits for an eligible spouse to become entitled to benefits. An eligible divorced spouse, however, may become independently entitled to benefits if the worker is eligible for (but has not yet claimed) benefits and the couple has been divorced for at least two years. (Social Security Administration, Program Operations Manual System [POMS], Section RS 00202.001 [Spouse], <http://policy.ssa.gov/poms.nsf/links/0300202001>). If a person has more than one former spouse, he or she is entitled to a spousal benefit based on the earnings record of the highest-earning spouse.

<sup>13</sup> As noted above, a divorced surviving spouse may qualify for mother's or father's benefits regardless of the length of marriage to the primary earner.

<sup>14</sup> One study showed that first marriages which ended in divorce lasted a median of 8 years for men and women overall, using data from Survey of Income and Program Participation (SIPP), 2008 Panel. (Census Bureau, *Number, Timing and Duration of Marriages and Divorces: 2009*, May 2011, Table 8, <http://www.census.gov/prod/2011pubs/p70-125.pdf>.) Another study finds that the median duration of the first marriage at time of divorce for women age 15 and older is 12 years using American Community Survey, 2012. (Spangler A., and Payne, K.K.(2014). *Marital Duration at Divorce*, 2012, (FP-14-11), National Center for Family & Marriage Research.) In addition, one study shows that the average duration of the first marriage is about 9.2 years using the National Longitudinal Survey of Youth 1979. (Bureau of Labor Statistics, *Marriage and divorce: patterns by gender, race, and educational attainment*, October 2013, available at <https://www.bls.gov/opub/mlr/2013/article/marriage-and-divorce-patterns-by-gender-race-and-educational-attainment.htm>.)

have a marriage that lasted longer than 10 years was higher from 1960 to 1964 than those in recent decades. About 83% of women who married for the first time during the early 1960s stayed married for 10 years or longer; however, for women who married between 1970 and 1999, about 71%-75% of women's first marriages have lasted for 10 years or more. This percentage dropped to 58% for women who first married during the early 2000s.

**Table I. Percentage Reaching 10<sup>th</sup> Marriage Anniversary, by Marriage Cohort and Sex, for First Marriages**

Year of Marriage	Male	Female
1960-1964	83.4	82.8
1965-1969	80.0	79.3
1970-1974	75.0	74.5
1975-1979	73.4	72.8
1980-1984	74.3	71.1
1985-1989	75.4	74.5
1990-1994	77.3	74.5
1995-1999	71.1	72.2
2000-2004	58.7	57.5

**Source:** Census Bureau, *Number, Timing and Duration of Marriages and Divorces: 2009*, May 2011, Table 4, <http://www.census.gov/prod/2011pubs/p70-125.pdf>; and the Congressional Research Service (CRS) calculations from the 2014 Survey of Income and Program Participation Social Security Administration Supplement.

**Notes:** The Census Bureau has not updated their *Number, Timing and Duration of Marriages and Divorces* since 2011; data for 1995-2004 are based on CRS calculations from the 2014 Survey of Income and Program Participation Social Security Administration Supplement.

Other data suggest that, for men and women aged 15 to 44 between 2006 and 2010, the probability of a first marriage lasting 10 years or longer was 68%. The probability that a first marriage would remain intact for at least 10 years was 73%, 56%, and 68% for Hispanic, black, and white women, respectively.<sup>15</sup> In addition, among the women who were first divorced in 2012, 60% of them had a marriage lasting for 10 or more years.<sup>16</sup>

## Dually Entitled Beneficiaries

A person may qualify for a spousal or survivor benefit as well as for a Social Security benefit based on his or her own work record (a retired-worker benefit). In such cases, the person in effect receives the *higher* of the worker benefit and the spousal or survivor benefit. When the person's retired-worker benefit is higher than the spousal or survivor benefit to which he or she would be entitled, the person receives only the retired-worker benefit. Conversely, when the person's retired-worker benefit is lower than the spousal or survivor benefit, the person is referred to as *dually entitled* and receives the retired-worker benefit plus a spousal or survivor benefit that is

<sup>15</sup> Casey E. Copen et al., *First Marriages in the United States: Data from the 2006-2010 National Survey of Family Growth*, National Center for Health Statistics, National Health Statistics Report no. 49, March 2012, Figures 5, available at <https://www.cdc.gov/nchs/data/nhsr/nhsr049.pdf>.

<sup>16</sup> Spangler A., and Payne, K.K. (2014). *Marital Duration at Divorce, 2012*. (FP-14-11), National Center for Family & Marriage Research. Retrieved from <https://www.bgsu.edu/content/dam/BGSU/college-of-arts-and-sciences/NCFMR/documents/FP/FP-14-11-marital-duration-2012.pdf>.

equal to the difference between the retired-worker benefit and the full spousal or survivor benefit. In essence, the person receives a total benefit amount equal to the higher spousal benefit.

Women have increasingly become entitled to Social Security benefits based on their own work records, either as retired-worker beneficiaries only or as dually entitled beneficiaries. As shown in **Figure 1**, the percentage of women aged 62 or older entitled to benefits based on their own work records—as retired workers or as dually entitled beneficiaries—grew from 43% in 1960 to 79.3% in 2017. More than half of this growth was in the percentage of dually entitled beneficiaries. The percentage of women aged 62 or older entitled to benefits based solely on their own work records fluctuated between 36% and 42% between 1960 and 2005, before increasing to 54.2% in 2017. In 2017, 45.7% of women aged 62 or older relied to some extent on benefits received as a spouse or survivor: 25% of spouse and survivor beneficiaries were dually entitled and 20.7% received spousal or survivors benefits only.

**Figure 1. Basis of Entitlement for Women Aged 62 or Older, 1960-2017, Selected Years**

**Source:** Social Security Administration, *Annual Statistical Supplement, 2018*, Table 5.A14, <https://www.ssa.gov/policy/docs/statcomps/supplement/2018/5a.pdf>.

As shown in **Table 2**, among wives who were dually entitled spousal beneficiaries in December 2017, the retired-worker benefit accounted for 68% of the combined monthly benefit (the retired-worker benefit with a top-up provided by the spousal benefit) and the spousal benefit accounted for 32% of the combined monthly benefit, on average. Among widows who were dually entitled survivor beneficiaries, the retired-worker benefit and the widow(er)'s benefit each accounted for about half of the combined monthly benefit, on average. Many more women than men are dually entitled to retired-worker benefits and spousal or widow(er)'s benefits. As shown in the table, in December 2017, about 6.9 million women and 235,533 men were dually entitled to benefits.

**Table 2. Average Benefit Levels Among Retired Workers With Dual Entitlement, December 2017**

Type of Secondary Benefit	Number	Average Monthly Benefit:		
		Combined Benefit	Retired-Worker Benefit	Reduced Secondary Benefit
<b>All</b>	7,163,736	\$1,261	\$715	\$546
<b>Spouses</b>	3,135,040	867	589	278
Wives of Retired and Disabled Workers	3,052,136	869	589	279
Husbands of Retired and Disabled Workers	82,904	799	583	217
<b>Widow(er)s</b>	4,028,301	1,568	813	754
Widows	3,875,672	1,570	802	768
Widowers	52,629	1,511	1,107	403
<b>Parents</b>	395	1,445	655	790

**Source:** Social Security Administration, *Annual Statistical Supplement, 2018*, Table 5.G3, <https://www.ssa.gov/policy/docs/statcomps/supplement/2018/5g.html#table5.g3>.

**Note:** Retired-worker benefit and reduced secondary benefit might not sum to the combined benefit due to rounding.

## Women, Social Security, and Auxiliary Benefits

Spousal and survivors benefits play an important role in ensuring women's retirement security. In December 2017, about 25.4 million elderly (aged 65 and older) women received Social Security benefits, including 13.3 million women who received only retired-worker benefits, 2.1 million women who were entitled solely as the spouse of a retired worker, 3.2 million women who were entitled solely as the survivor of a deceased worker, and 6.7 million women who were dually entitled to a retired-worker benefit and a spousal or survivor benefit.<sup>17</sup> In 2017, Social Security provided 50% or more of family income for more than 53% of elderly women in beneficiary families and 90% or more of family income for about 28% of elderly women in beneficiary families.<sup>18</sup>

Women, however, continue to be vulnerable to poverty in old age for several reasons. These reasons can generally be split into demographic reasons and economic reasons. In addition, the design of auxiliary benefits can lead to equity concerns.

With respect to demographic and economic reasons that lead to adequacy concerns,

- Women on average live longer than men, and thus more women are likely to be widowed than are men. Women reaching the age of 65 in 2017 are likely to live

<sup>17</sup> Social Security Administration, *Annual Statistical Supplement, 2018*, Table 5.A15, <https://www.ssa.gov/policy/docs/statcomps/supplement/2018/5a.html#table5.a15>.

<sup>18</sup> CRS Analysis of data from the U.S. Census Bureau, 2018 Annual Social and Economic Supplements to the Current Population Survey (CPS ASEC).

another 20.7 years, on average, compared with another 18.2 years for men.<sup>19</sup> About 5% of women aged 50-59, about 16% of women aged 60-75, and about 56% of women aged 75 and older are currently widowed. By comparison, about 2% of men aged 50-59, about 5% of men aged 60-75, and about 21% of men aged 75 and older are widowed.<sup>20</sup> As a consequence, women may spend more time in retirement and are more vulnerable to inflation and the risk of outliving other assets. The real value of private pension benefits declines with age, as private pensions are generally not adjusted for inflation, and some private pensions cease with the death of the retired worker.

- Women are more likely to take employment breaks to care for children or parents, and thus have a lower labor force participation rate than men. During 2016, 88.5% of men and 74.3% of women aged 25-54 participated in the labor force.<sup>21</sup> The rate for women with children under three years old was lower, at 63%.<sup>22</sup> Breaks in employment result in fewer years of contributions to Social Security and employer-sponsored pension plans and thus lower retirement benefits.
- The median earnings of women who are full-time wage and salary workers are 82% of their male counterparts.<sup>23</sup> Because Social Security and private pension benefits are linked to earnings, this “earnings gap” can lead to lower benefit amounts for women than for men.

Social Security benefits are designed in a way that can result in inequities between households with similar earning profiles. Spousal and survivors benefits were added to the Social Security system in 1939. At that time, the majority of households consisted of a single earner—generally the husband—and a wife who was not in the paid workforce but instead stayed home to care for children. However, in recent decades, women have increasingly assumed roles as wage earners or as heads of families.

A beneficiary who qualifies for both a retired-worker benefit and a spousal benefit does not receive both benefits in full. Instead, the spousal benefit is reduced by the amount of the retired-worker benefit; this effectively means the beneficiary receives the higher of the two benefit amounts. Because of this, a two-earner household receives lower combined Social Security benefits than a single-earner household with identical total Social Security-covered earnings, despite paying more in Social Security taxes. Moreover, after the death of one spouse, the disparity in benefits may increase: in a one-earner couple, the surviving spouse receives two-thirds of what the couple received on a combined basis, whereas in some two-earner couples with

roughly equal earnings, the surviving spouse receives roughly one-half of what the couple received on a combined basis.<sup>24</sup>

## Adequacy Issues

Social Security is credited with keeping many of the elderly out of poverty. However, in 2017, 6.5% of Social Security beneficiaries aged 65 or older were below the poverty line.<sup>25</sup> **Figure 2** highlights the differences in poverty status among men and women aged 65 or older who received Social Security benefits in 2017, after Social Security is combined with other sources of income such as earnings from work, pensions, income from assets, and cash assistance.<sup>26</sup>

**Figure 2. Poverty Status of Social Security Beneficiaries Aged 65 or Older in 2017, by Gender and Marital Status**

**Source:** CRS analysis of data from the U.S. Census Bureau, Current Population Survey, 2018 Annual Social and Economic Supplements (CPS ASEC).

**Notes:** Married persons are married and living with their spouse. Nonmarried persons may be divorced, widowed, never married, separated, or married but living apart from their spouse. Because the categories are by marital status, the “widowed” and “divorced” categories will include beneficiaries receiving widow(er) and divorced spouse benefits and beneficiaries receiving retired-worker benefits (based on his or her own work record). Definitions and methodology are consistent with Social Security Administration, *Income of the Population 55 or Older, 2014*, April 2016, Table I 1.3, [https://www.ssa.gov/policy/docs/statcomps/income\\_pop55/2014/sect11.html#table11.3](https://www.ssa.gov/policy/docs/statcomps/income_pop55/2014/sect11.html#table11.3).

**Figure 2** shows that married beneficiaries have significantly lower poverty rates than nonmarried beneficiaries and that nonmarried women aged 65 or older—including widowed, divorced, and never-married women—are more likely to be in poverty than their male counterparts. Particularly vulnerable among women are divorced beneficiaries and the never-married. Among women aged

<sup>24</sup> See the example in **Table 4**.

<sup>25</sup> CRS analysis of data from the U.S. Census Bureau, Current Population Survey, 2018 Annual Social and Economic Supplements (CPS ASEC).

<sup>26</sup> In 2017, the poverty threshold for a single person aged 65 or older was \$11,756 and for a married couple with a householder aged 65 or older (and no related children) it was \$14,828. (Source: Census Bureau, Poverty Thresholds, <https://www.census.gov/data/tables/time-series/demo/income-poverty/historical-poverty-thresholds.html>.)

65 and older, about 13.7% of divorced Social Security beneficiaries and 18.0% of never-married Social Security beneficiaries have total incomes below the official poverty line in 2017. Among Social Security beneficiaries aged 65 and over, poverty rates are also high among never-married men, at a rate of 17.5% in 2017.

The reasons for the disparity in poverty rates among elderly men and women relate in part to women's lower lifetime earnings, which affect Social Security benefits and private pensions. Low lifetime earnings can be due to lower labor force participation of women and the earnings gap. In addition, women live two to three years longer than men on average, making them more likely to exhaust retirement savings and other assets before death. In addition, if the deceased husband was receiving a pension, the widow's benefit may be significantly reduced, or the pension may cease with the husband's death, depending on whether the couple had a joint and survivor annuity and how the joint and survivor annuity was structured. Elderly widows also may be at risk if assets are depleted by health-related expenses prior to the spouse's death.

### Labor Force Participation of Women

During the past several decades, the labor force participation rate among women increased, but still remained below the rate among men. In 1950, about 34% of women aged 16 or older participated in the labor force, compared with about 86% of men aged 16 or older. By 2016, about 57% of women aged 16 or older participated in the labor force, compared with 69% of men in the same age group.<sup>27</sup> Women are also more likely than men to work part-time (i.e., less than 35 hours per week in a sole or principal job). In 2016, 25% of women in wage and salary jobs worked part-time, compared with 12% of men.<sup>28</sup>

Women with children under the age of 18 have increasingly entered the labor force in recent decades (see **Figure 3**). However, women with children have fewer years of paid work, on average. By the age of 50, women without children who were born between 1948 and 1958 had worked on average about two years less than men overall (i.e., men with and without children). For a woman with two children, however, the gap at the age of 50 was about 6.5 years less than the average man with or without children.<sup>29</sup> In 2017, about 69% of mothers were employed, compared with 91% of fathers.<sup>30</sup>

In addition to childcare, women are also more likely than men to provide care to a spouse, a parent, or some other adult relative. One survey estimates that, among 39.8 million caregivers who have provided unpaid care to an adult in 2015, 60% of them are female.<sup>31</sup> Some researchers find that female caregivers tend to work fewer hours per week and earn a lower wage than non-caregivers.<sup>32</sup> Another study shows that women who leave work to provide care may face relatively low probabilities of returning to work.<sup>33</sup>

## Earnings Gap

Another reason why women receive lower retired-worker benefits than men is that full-time women workers earn about 80%-82% of the median weekly earnings of their male counterparts.<sup>34</sup> In 2016, women who were full-time wage and salary workers had median weekly earnings of \$749, or about 82% of the \$915 median earned by their male counterparts. The women's-to-men's earnings ratio was about 62% in 1979 and, after increasing gradually during the 1980s and 1990s, has ranged between 80% and 82% since 2004.<sup>35</sup>

<sup>34</sup> If the population were ranked from lowest to highest based on earnings level, the earnings level at the middle of the distribution would be the median value.

<sup>35</sup> Bureau of Labor Statistics, *Women in the Labor Force: A Databook*, November 2017, Table 16, <https://www.bls.gov/opub/reports/womens-databook/2017/home.htm>.

In 2016, the earnings gap between women and men varied among age groups (see **Table 3**). Among full-time workers, women aged 16-24 earned about 95% as much as men; women aged 25-34 earned about 89% as much as men; and women aged 55-64 earned about 74% as much as men.

Over time, the earnings gap between women and men has narrowed for most age groups. For example, among full-time workers aged 25-34, the women's-to-men's earnings ratio increased from 68% in 1979 to 89% in 2016. For workers aged 35-44, the earnings ratio increased from 58% in 1979 to 83% in 2016. Similarly, for workers aged 45-54, the earnings ratio increased from 57% in 1979 to 78% in 2016. Part of the earnings gap can be attributed to differences between men's and women's years of education, full-time work experience, and occupations.<sup>36</sup>

Comparing the annual earnings of women and men may understate differences in total earnings across longer periods. Using a 15-year time frame (1983-1998), one study found that women in the prime working years of 26 to 59 had total earnings that were 38% of what prime-age men earned, in total, over the same 15-year period.<sup>37</sup> Another study found that women born between 1955 and 1959 who worked full-time, year-round each year would have an average lifetime loss of \$531,500 by age 59, compared with men.<sup>38</sup>

**Table 3. Women's Earnings as a Percentage of Men's Earnings, 1979 and 2016**

Age	Women's Earnings as a Percentage of Men's, 1979	Women's Earnings as a Percentage of Men's, 2016
Total, 16 years and older	62.3%	81.9%
Total, 16 to 24 years	78.6%	94.9%
Total, 25 years and older	62.1%	80.9%
25 to 34 years	67.5%	88.8%
35 to 44 years	58.3%	83.3%
45 to 54 years	56.8%	77.8%
55 to 64 years	60.6%	73.7%
65 years and older	77.6%	75.5%

**Note:** Ratios are for men and women who are full-time wage and salary earners with median earnings.

As women enter the work force in greater numbers, more women will qualify for Social Security benefits based on their own work records, instead of a spousal benefit that is equal to 50% of the husband's PIA. However, retired-worker and disabled-worker benefits for women continue to be lower than those for men on average for a variety of reasons, as discussed above. Consequently,

<sup>36</sup> See CRS In Focus IF10414, *The Gender Earnings Gap*.

<sup>37</sup> Stephen J. Rose and Heidi I. Hartmann, *Still a Man's Labor Market: The Long-Term Earnings Gap*, Institute for Women's Policy Research, 2004, <https://iwpr.org/wp-content/uploads/wpallimport/files/iwpr-export/publications/C355.pdf>.

<sup>38</sup> Institute for Women's Policy Research, *The Status of Women in the States: 2015: Employment & Earnings*, March 2015, <http://statusofwomendata.org/wp-content/uploads/2015/09/PDF-of-final-Employment-Earnings-chapter-9-4-15.pdf>.

after the death of a husband, the survivor's benefit, which is equal to 100% of the husband's PIA, will continue to play an important role in the financial well-being of widows.

## Equity Issues

Although Social Security provides essential income support to nonworking spouses and widows, the current-law spousal benefit structure can lead to a variety of incongruous benefit patterns that have been documented in the literature.<sup>39</sup> For example, a woman who was never employed but is married to a man with high Social Security-covered wages may receive a Social Security spousal benefit that is higher than the retirement benefit received by a single woman, or a woman who was married less than 10 years, who worked a full career in a low-wage job.

The current system provides proportionately more benefits relative to payroll-tax contributions to one-earner couples (which predominated when Social Security was created in the 1930s) than to single persons or to couples with two earners, on average. As a result, the current system can lead to situations in which Social Security provides unequal benefits to one-earner and two-earner couples with the same total household lifetime earnings. Putting this in a different perspective, some two-earner couples may have to contribute significantly more to Social Security to receive the same retirement and spousal benefits that the system provides to a one-earner couple with identical total household earnings. As women's share of household income has increased, and also as women have increasingly become heads of families, these anomalies could become more relevant.

**Table 4** illustrates the disparate treatment of one-earner and two-earner couples with examples developed by the American Academy of Actuaries. In the table, a one-earner couple with household earnings of \$50,000 is compared with two different two-earner couples. The second couple in the comparison is a two-earner couple with the same total household earnings (\$50,000) as the one-earner couple, with the earnings evenly split between the two spouses (each spouse earns \$25,000). The third couple in the comparison is a two-earner couple in which one spouse earns \$50,000 (the same as the primary earner in the one-earner couple) and the other spouse earns half that amount, or \$25,000, for total household earnings of \$75,000.

**Table 4. Benefits for Three Couples with Different Earnings Splits  
Between Husband and Wife, 2017**

	<b>First Couple: One Earner with Earnings of \$50,000</b>	<b>Second Couple: Two Earners with Total Household Earnings of \$50,000 Split Evenly</b>	<b>Third Couple: Two Earners with Earnings of \$50,000 and \$25,000</b>
Total household earnings	\$50,000	\$50,000	\$75,000
Spouse A earns	\$50,000	\$25,000	\$50,000
Spouse B earns	\$0	\$25,000	\$25,000
Annual Social Security payroll taxes (employee share only)	\$3,100	\$3,100	\$4,650

<sup>39</sup> See, for example, Christopher R. Tamborini and Kevin Whitman, "Women, Marriage and Social Security Benefits Revisited," *Social Security Bulletin*, vol. 67, no. 4 (2007). See also Alicia H. Munnell, Geoffrey Sanzenbacher, and Mauricio Soto, *Working Wives Reduce Social Security Replacement Rates*, Center for Retirement Research, no. 7-15, October 2007.

	<b>First Couple: One Earner with Earnings of \$50,000</b>	<b>Second Couple: Two Earners with Total Household Earnings of \$50,000 Split Evenly</b>	<b>Third Couple: Two Earners with Earnings of \$50,000 and \$25,000</b>
Total monthly benefit paid to couple at retirement	\$2,655 total (equals \$1,770 worker benefit to Spouse A and \$885 spousal benefit to Spouse B)	\$2,240 total (equals \$1,120 worker benefit to Spouse A and \$1,120 worker benefit to Spouse B)	\$2,890 total (equals \$1,770 worker benefit to Spouse A and \$1,120 worker benefit to Spouse B)
Total monthly benefit paid to survivor	\$1,770	\$1,120	\$1,770

**Source:** American Academy of Actuaries, *Women and Social Security*, Issue Brief, May 2017.

As the table illustrates, a one-earner couple may receive higher retirement and survivors benefits than a two-earner couple with identical total household earnings. Specifically, the first couple with one earner receives a total of \$2,655 in monthly retirement benefits, compared with the second couple with two earners, who receives a total of \$2,240 in monthly retirement benefits.<sup>40</sup> Similarly, the survivor of the one-earner couple receives \$1,770 in monthly benefits (either as a retired worker or as a surviving spouse). In comparison, the survivor of the two-earner couple with identical total household earnings receives \$1,120 in monthly benefits.

In the third couple shown in **Table 4**, both spouses work in Social Security-covered employment, but in this example one spouse earns \$50,000 annually and the other spouse earns \$25,000. This couple receives monthly benefits that are \$235 higher than the monthly benefits received by the one-earner couple (\$2,890 compared with \$2,655); however, this couple has earned much more over time (\$25,000 annually) and contributed commensurately more in Social Security payroll taxes (\$1,550 annually). The survivor benefit received by the third couple is identical to that received by the one-earner couple. Thus, the current-law Social Security spousal benefit structure requires some two-earner couples to make substantially higher contributions for similar benefit levels. With higher earnings but similar benefits to the one-earner couple, the third couple's replacement rate of 46% (i.e., family total monthly benefits as a percentage of preretirement earnings) is lower than that of the one-earner couple, which is 64%.<sup>41</sup>

After the death of one spouse, the disparity in benefits between one-earner and two-earner couples may increase, as shown in the table. For the one-earner couple, the surviving spouse receives a benefit equal to two-thirds of the couple's combined benefit (for a reduction equal to one-third of the couple's combined benefit).<sup>42</sup> For a two-earner couple with equal earnings (the

<sup>40</sup> The internal real rate of return in this case is the discount rate, which equals the present value of expected payroll taxes and the present value of expected benefits, and it is 4.40% for the one-earner couple and 3.93% for the two-earner couple. The numbers are calculated by CRS using the methodology described in Nichols, Orlo, Michael Clingman and Alice Wade, 2005, "Internal Real Rates of Return Under the OASDI Program for Hypothetical Workers", SSA Office of the Chief Actuary, Actuarial Note Number 2004.5, available at <https://www.ssa.gov/OACT/NOTES/ran5/an2004-5.html#wp158362>.

<sup>41</sup> For further discussion of replacement rates among couples with different earnings histories, see Alicia H. Munnell, Geoffrey Sanzenbacher, and Mauricio Soto, *Working Wives Reduce Social Security Replacement Rates*, Center for Retirement Research, no. 7-15, Boston, MA, October 2007. The authors argue that wives' entrance into the labor market, and the ensuing rise in the ratio of wives' earnings to husbands' earnings, has lowered the replacement rate received by average-earning married couples from 50% of preretirement income to 45% over the past 40 years.

<sup>42</sup> On a combined basis, the couple received 150% of the worker's PIA. The surviving spouse receives 100% of the worker's PIA. This results in a reduction equal to one third of the couple's combined benefit.

second couple), the surviving spouse receives a benefit equal to one-half of the couple's combined benefit.

Further, the surviving spouse in the first couple (the one-earner couple) receives a larger monthly benefit than the survivor of the second couple (a two-earner couple with earnings evenly split)—\$1,770 compared with \$1,120—although both couples paid the same amount of Social Security payroll tax contributions. Similarly, compared with the one-earner couple, the surviving spouse in the third couple (a two-earner couple with unequal earnings and higher total earnings than the one-earner couple) receives the same monthly benefit (\$1,770) although the couple paid a higher amount of Social Security payroll tax contributions. For both two-earner couples in these examples, after the death of one spouse, the second earnings record does not result in the payment of any additional benefits.<sup>43</sup>

When spousal and survivors benefits were first established, most households consisted of a single earner—usually the husband—and a wife who cared for children and remained out of the paid workforce. As a result, benefits for nonworking spouses were structured to be relatively generous. Over the past six decades, women's earnings have increased and the share of households who have one earner has declined, and thus the share of women beneficiaries who received Social Security benefits solely based on husband's earnings record has decreased (see **Figure 1**).

In addition to inequities among couples with different work histories and earnings levels, the current structure of Social Security auxiliary benefits creates inequities among the divorced. Divorced spouses with 9½ years of marriage, for example, receive no Social Security spousal and survivors benefits, whereas divorced spouses with 10 or more years of marriage may receive full spousal and survivors benefits.

## Other Program Design Considerations

The current structure of Social Security spousal and survivors benefits raises other considerations for lawmakers with respect to potential policy changes.

- Social Security automatically provides pension rights to one or more eligible divorced spouses, in contrast to private pensions. Further, the benefit payable to the primary earner is not reduced for benefits paid to a current or one or more former spouses, again in contrast to private pensions.
- Divorced spouses receive a higher benefit after the death of their former spouse (the primary earner): benefits for a divorced spouse are equal to 50% of the primary earner's PIA, while benefits for a divorced surviving spouse are equal to 100% of the primary earner's PIA. This can create volatility in the income of divorced spouses.
- Widow(er)s who had high-earning spouses may face disincentives to marry a lower-earning second husband (if remarriage occurs before the eligibility age for widow[er]'s benefits).

In response to the adequacy, equity, and other program design issues described above, policymakers and researchers have proposed a number of ways to restructure Social Security auxiliary benefits. Some of these proposals are discussed in the following section.

<sup>43</sup> American Academy of Actuaries, *Women and Social Security*, Issue Brief, May 2017. For a related discussion, see the proposal entitled, "Survivor's Benefit Increased to 75% of Couple's Combined Benefit," below.

## Proposals for Restructuring Social Security Spousal or Survivors Benefits

A number of proposals have been put forward to modify the current structure of Social Security spousal and survivors benefits. These proposals have different potential consequences for benefit levels of current, divorced, and surviving spouses; for the redistribution of benefits among couples from different socioeconomic levels; for the eligibility of means-tested programs such as Supplemental Security Income; and for work incentives.

### Earnings Sharing

Earnings sharing has been suggested as a way to address the unequal treatment of one-earner versus two-earner couples under current law. As noted above, Social Security often provides higher benefits to one-earner couples than to two-earner couples with the same total household earnings. In addition, earnings sharing has sometimes been suggested as a way to provide benefits to divorced women whose marriages did not last long enough (at least 10 years) to allow them to qualify for divorced spousal or survivors benefits. By definition, earnings sharing would not affect never-married persons.

Under the most basic form of earnings sharing, spousal and survivors benefits would be eliminated. Instead, for each year of marriage, a couple's covered earnings would be added together and divided evenly between the spouses. For years when an individual is not married, his or her own earnings would be recorded. If a person has multiple marriages, the earnings sharing would occur during each period of marriage. Both members of a couple would have individual earnings records reflecting shared earnings as a member of the couple as well as any earnings before or after the marriage. Social Security benefits would be computed separately for each member of the couple, based on the individual earnings records and using the current-law benefit formula. For couples who were married for the entire career of one or both members, both members of the couple would receive identical benefits and the couple's combined benefit would be equal to twice that of either member of the couple. The two spouses would receive different benefits, however, if either had earnings before or after the marriage.

Earnings sharing proposals would reduce benefits for the majority of individuals, relative to current law, and in the absence of other benefit enhancements. For example, a 2009 Social Security Administration (SSA) study (hereinafter, 2009 SSA Study)<sup>44</sup> found that 61% of individuals would receive average benefit reductions of about 17%. About 11% of individuals would experience no change in benefits, and 28% would experience benefit increases averaging about 10%. Among married couples, the benefit decrease under earnings sharing proposals would be substantially larger among individuals in one-earner married couples than two-earner married couples.<sup>45</sup> This is mainly because the current system on average provides proportionately more

---

<sup>44</sup> Howard M. Iams, Gayle L. Reznik, and Christopher R. Tamborini, "Earnings Sharing in Social Security: Projected Impacts of Alternative Proposals Using the MINT Model," *Social Security Bulletin*, vol. 69, no. 1 (2009). SSA's study focuses on the impact of earnings sharing on benefits received by the population that will be aged 62 or older in 2030. The net change in the lifetime benefit amount of each beneficiary or average beneficiary is not discussed in the study.

<sup>45</sup> See also U.S. House Committee on Ways and Means, Subcommittee on Social Security, "Report on Earnings Sharing Implementation Study", February 14, 1985; Congressional Budget Office, "Earnings Sharing Options for Social Security System", January 1986; and Melissa M. Favreault and C. Eugene Steuerle, *Social Security Spouse and Survivor Benefits for the Modern Family*, The Urban Institute/The Retirement Security Project, Discussion Paper 07-01, Washington, DC, March 2007, p. 19.

benefits relative to payroll-tax contributions to one-earner couples than to couples with two earners, but under earnings sharing, couples with the same total lifetime earnings generally would receive the same benefits regardless of their individual earnings profiles, all things being equal.

Studies have found that the largest benefit reductions under earnings sharing could affect widows and divorced women. The 2009 SSA study found that about 93% of widows would experience an average benefit reduction of 27% while 45% of divorced women would experience benefit reductions averaging about 22%.<sup>46</sup> A 2016 study found that 39% of divorced women and 62% of widows would experience a median decrease in benefits of 6% and 14%, respectively.<sup>47</sup>

The decline in widow's benefits results from eliminating the surviving spouse benefit under current law and replacing it with earnings credits. The widow's benefit under current law is equal to 100% of the husband's PIA, where the husband's PIA is determined based on unshared earnings. Although earnings sharing would increase the amount of earnings credited to the surviving wife (assuming the husband was the higher earner), the benefit payable to the surviving wife based on shared earnings would be lower than the current-law widow's benefit. Another study found that the gains experienced by divorced spouses and some married women under earnings sharing would come largely at the expense of widowed men and women.<sup>48</sup>

Some earnings sharing proposals would mitigate these effects by providing enhanced benefits to survivors or other targeted groups. For example, an "inheritance provision" could allow a surviving spouse to count all (instead of half) of a deceased spouse's earnings (or those of a deceased former spouse) during each year of marriage, in addition to all of his or her own earnings. An inheritance provision would protect some, though not all, surviving spouses. For example, the 2009 SSA study found that 40% of widows would receive lower benefits relative to current law under earnings sharing with an inheritance provision (compared with 93% without the inheritance provision).

Alternatively, benefits for surviving spouses could be based on an amount equal to two-thirds of the combined benefit the couple was receiving when both members of the couple were alive (see "Survivor's Benefit Increased to 75% of Couple's Combined Benefit" below), or special provisions could be targeted to surviving disabled spouses.<sup>49</sup>

Provisions to protect survivors from benefit reductions, however, would reduce the amount of savings that would otherwise be achieved through program changes. Similarly, provisions to increase benefits for survivors relative to current law would increase program costs. A higher survivor benefit could be self-financed by reducing, on an actuarially fair basis, the combined benefit the couple receives while both members of the couple are alive.<sup>50</sup>

---

<sup>46</sup> The 2009 SSA study also found that 96% of widowers in 2030 would experience an average benefit reduction of 20%.

<sup>47</sup> Kenneth Couch, Gayle Reznik, and Christopher Tamborini, et al., "The Distributional Impact of Social Security Policy Options: An Analysis of Divorced and Widowed Women," *Research on Aging*, vol. 39, no. 1 (2016), pp. 135-165. For the purposes of the study, a "benefit increase" is defined as a 1% or greater increase in the 2030 benefit amount under the policy change, relative to current law.

<sup>50</sup> Melissa M. Favreault and C. Eugene Steuerle, *Social Security Spouse and Survivor Benefits for the Modern Family*, The Urban Institute/The Retirement Security Project, Discussion Paper 07-01, Washington, DC, March 2007.

## Divorced Spouse Benefits

Under the current Social Security program, a divorced spouse must have been married to the worker for at least 10 years to qualify for spousal and survivors benefits based on the worker's record, as discussed above. Benefits for divorced spouses are equal to 50% of the worker's PIA; benefits for divorced surviving spouses are equal to 100% of the worker's PIA. One approach to extend Social Security spousal and survivors benefits to more divorced spouses would be to lower the 10-year marriage requirement (for example, to 5 or 7 years). Proposals to lower the length-of-marriage requirement for divorced spouses would improve benefit adequacy for some, although not all, divorced women.

One study<sup>51</sup> estimated that lowering the marriage-duration requirement from 10 to 7 years would increase benefits for about 8% of divorced women and 2% of widowed women aged 60 or older in the year 2030. Lowering the marriage-duration requirement to 5 years (with a proportional decrease to benefit amounts) would increase benefits for about 11% of all divorced women in the year 2030. The study found that, among divorced women aged 60 and over who would receive higher benefits as a result of lowering the marriage-duration requirement to 5 or 7 years, the outcomes were moderately progressive in the sense that they channeled a greater share of benefit increases to low-income and non-college-educated divorced women in old age. For example, under a 7-year marriage-duration requirement, about 10% of divorced women in the lowest retirement income quintile would receive a benefit increase compared with around 4% in the highest quintile who would receive a benefit increase. Among divorced women who gain, women in the lowest retirement income quintile would see a median benefit increase of 79%, compared with a median increase of 25% among women in the highest quintile. An earlier study found a similar result.<sup>52</sup>

Some researchers contend that the 50% benefit rate for divorced spouses (50% of the worker's PIA) is not sufficient to prevent many divorced spouses from falling into poverty.<sup>53</sup> The 50% benefit rate for spouses initially was established to supplement the benefit received by a one-earner couple (i.e., in 1939, a spousal benefit was provided for a dependent wife to supplement the benefit received by the worker).<sup>54</sup> Some observers contend that it may not be sufficient for persons (divorced spouses) who may be living alone. As described above, about 13.7% of divorced women and 10.3% of divorced men aged 65 and older have incomes below the poverty

<sup>51</sup> Kenneth Couch, Gayle Reznik, and Christopher Tamborini, et al., "The Distributional Impact of Social Security Policy Options: An Analysis of Divorced and Widowed Women," *Research on Aging*, vol. 39, no. 1 (2016), pp. 135-165. For the purposes of the study, a "benefit increase" is defined as a 1% or greater increase in the 2030 benefit amount under the policy change, relative to current law.

<sup>52</sup> Christopher R. Tamborini and Kevin Whitman, "Lowering Social Security's Duration-of-Marriage Requirement: Distributional Effects for Future Female Retirees," *Journal of Women and Aging*, vol. 22 (2010), pp. 184-203. For the purposes of the study, a "benefit increase" is defined as a 1% or greater increase in the 2030 benefit amount under the policy change, relative to current law. The study suggests that a large proportion of divorced female retirees in 2010 will have a retired-worker benefit (based on their own earnings histories) which exceeds the divorced-spouse benefit (50% of the former spouse's benefit), but which is less than the surviving divorced-spouse benefit (100% of the deceased former spouse's benefit). That is, much of the benefit increases in 2030 would accrue to divorced surviving spouses who were receiving a retired-worker benefit while the former spouse was alive but became dually entitled upon the death of the former spouse before 2030. (Because the study addresses benefits in the year 2030, it does not include some divorced women who would receive higher benefits upon the death of a former spouse at a later date.)

<sup>53</sup> As discussed in David A. Weaver, "The Economic Well-Being of Social Security Beneficiaries, With an Emphasis on Divorced Beneficiaries," *Social Security Bulletin*, vol. 60, no. 4 (1997), p. 11.

<sup>54</sup> See Arthur J. Altmeyer, "Dependents' Allowances in Social Insurance," *Social Security Bulletin*, vol. 10, no. 4 (April 1947), pp. 3-6, <https://www.ssa.gov/policy/docs/ssb/v10n4/>.

line, compared with 2.1% and 2.4% of married women and men respectively in 2017 (see **Figure 2**).

## Increased Benefits for the Oldest Old

Another type of benefit modification would increase benefits for the oldest old (for example, beneficiaries aged 80 or older, or after 20 years of benefit receipt) by a specified percentage such as 5%. One rationale for this proposal is that beneficiaries tend to exhaust their personal savings and other assets over time, becoming more reliant on Social Security at advanced ages. Another rationale is that, after the age of 60, Social Security retirement benefits do not keep pace with rising living standards. In particular, the formula for computing a worker's initial retirement benefit is indexed to national average wage growth through the age of 60 and then to price inflation (the Consumer Price Index for Urban Wage and Clerical Workers, or CPI-W) starting at the age of 62. Once a beneficiary begins receiving benefits, his or her benefits increase each year with price inflation (the annual cost-of-living adjustment, based on the CPI-W) so that the initial benefit amount is effectively fixed in real terms. Some argue that the CPI-W is an inaccurate measure of price inflation that seniors face.<sup>55</sup>

According to one study, a 5% bump-up in benefits at the age of 80 would result in a slight decline in poverty rates among widows and nonmarried retired-worker beneficiaries aged 80 or older (declines of 3 percentage points and 4 percentage points, respectively). The same study found that this option is not targeted toward low-income beneficiaries: less than 30% of the additional benefits would accrue to beneficiaries in the bottom quintile of the income distribution.<sup>56</sup> Another SSA study finds that a 5% benefit increase in the individual's primary insurance amount for beneficiaries aged 85 or older in 2030 would decrease the projected poverty rate from 1.5% to 1.2%.<sup>57</sup>

Alternatively, a benefit increase for the oldest old could be limited to beneficiaries who receive a below-poverty-level benefit. One proposal along these lines would provide a benefit to persons aged 82 or older that would be prorated based on the number of years the person contributed to Social Security.<sup>58</sup>

<sup>55</sup> For example, see Rep. John Paul Hammerschmidt, "Conference Report on H.R. 1451, Older Americans Act Amendments of 1987," House debate, *Congressional Record*, vol. 133, part 23 (November 17, 1987), p. 32119. The President's 2014 budget proposed basing the Social Security Cost-of-Living-Adjustment (COLA) on the chained CPI-U (Consumer Price Index for All Urban Consumers) instead of on the CPI-W, and the proposal would increase benefits for older beneficiaries (retired workers aged 76 and older and disabled workers after 14 years of benefit receipt). (Source: Fiscal Year 2014 Budget of the U.S. Government, page 46, at <https://www.gpo.gov/fdsys/pkg/BUDGET-2014-BUD/pdf/BUDGET-2014-BUD.pdf>.) Because the chained CPI-U tends to grow more slowly than the CPI-W, the provision of benefit increase for older beneficiaries would more than offset the expected effects of the lower COLA. Similarly proposals were made in 2010. See The National Commission on Fiscal Responsibility and Reform, *The Moment of Truth*, Washington, DC, December 2010, <http://momentoftruthproject.org/report>. See also Bipartisan Policy Center, *Restoring America's Future*, Washington, DC, November 2010, <https://bipartisanpolicy.org/library/restoring-america-future/>.

<sup>56</sup> Sharmila Choudhury, Michael V. Leonesio, and Kelvin R. Utendorf, et al., *Analysis of Social Security Proposals Intended to Help Women: Preliminary Results*, Social Security Administration, Office of Research, Evaluation, and Statistics, ORES Working Paper No. 88, Washington, DC, January 2001, p. 21.

<sup>57</sup> Whitman, Kevin, and Dave Shoffner, October 2013, "The Projected Effects of Social Security Benefit Increase Options for Older Beneficiaries," Social Security Administration, Policy Brief No. 2013-01. The relatively low poverty rate (1.5%) under scheduled benefits reflects that wealthier individuals are more likely to live to older ages and the projected decline in poverty due to real wage growth.

<sup>58</sup> John Turner, "Longevity Insurance: Strengthening Social Security at Advanced Ages" in *Strengthening Social Security for Vulnerable Groups*, ed. National Academy of Social Insurance (Washington, DC, 2009), pp. 45-48. The

Other proposals would link the Social Security COLA to the Experimental Consumer Price Index for Americans Aged 62 and Older (CPI-E), which grows faster than the CPI-W on average, and is projected to increase Social Security benefits.<sup>59</sup> Although the changes were targeted to all Social Security beneficiaries, those who received COLAs under the new policy for many years, such as the very old or people who had been disabled for a long period, tend to receive the largest benefit increase.<sup>60</sup>

## Minimum Benefit for Low Earners

Social Security already has a “special minimum” benefit designed to help workers with long careers at low wages.<sup>61</sup> A worker is awarded the special minimum benefit only if it exceeds the worker’s regular benefit. The value of the special minimum benefit, which is indexed to prices, is rising more slowly than the value of the regular Social Security benefit, which is indexed to wages. As a result, the number of beneficiaries who receive the special minimum benefit under current law declines each year, and the Social Security Administration projected that the special minimum benefit provision would have no effect on people turning 62 years old in 2019 or later.<sup>62</sup>

Some observers argue that a carefully designed minimum benefit has the potential to reduce poverty rates among older women, including divorced and never-married women, more efficiently than existing spousal and survivors benefits.<sup>63</sup> Minimum benefit proposals are aimed at improving the adequacy of benefits, in comparison with some other proposals that address issues of equity among individuals and couples with different marital statuses.

Most minimum benefit proposals would require the worker to have between 30 and 40 years of Social Security-covered earnings to qualify for a minimum benefit at the poverty line or somewhat above it (for example, 120% of the poverty line).<sup>64</sup> These work tenure requirements are

full report is available at [http://www.nasi.org/sites/default/files/research/Strengthening\\_Social\\_Security\\_for\\_Vulnerable\\_Groups.pdf](http://www.nasi.org/sites/default/files/research/Strengthening_Social_Security_for_Vulnerable_Groups.pdf).

<sup>59</sup> The CPI-E grows faster than the CPI-W, on average, because a larger portion of spending by the elderly goes to toward health care expenditures and other items whose prices tend to rise more rapidly. Several bills to set Social Security COLAs equal to growth in a CPI for the elderly have been introduced in the 115<sup>th</sup> Congress, such as H.R. 4076, H.R. 2896, H.R. 991, H.R. 3302, H.R. 1114, H.R. 2855, S. 427, and S. 1600. The CPI-E grows faster than the CPI-W, on average, because a larger portion of spending by the elderly goes to toward health care expenditures and other items whose prices tend to rise more rapidly.

<sup>60</sup> For more information on the chained CPI-U and CPI-E, see CRS Report R43363, *Alternative Inflation Measures for the Social Security Cost-of-Living Adjustment (COLA)*.

<sup>61</sup> For more information on the Special Minimum Benefit, see CRS Report R43615, *Social Security: Minimum Benefits*.

<sup>62</sup> Craig A. Feinstein, *Diminishing Effect of the Special Minimum PIA*, Social Security Administration, Actuarial Note No. 154, November 2013, [http://www.ssa.gov/oact/NOTES/pdf\\_notes/note154.pdf](http://www.ssa.gov/oact/NOTES/pdf_notes/note154.pdf).

<sup>63</sup> Melissa M. Favreault, Gordon B.T. Mermin, and C. Eugene Steuerle, *Minimum Benefits in Social Security*, AARP Public Policy Institute, Washington, DC, August 2006, p. 13. See also Pamela Herd, “Ensuring a Minimum: Social Security Reform and Women,” *The Gerontologist*, vol. 45, no. 1 (2005), pp. 12-25.

<sup>64</sup> For example, the second model proposed by the President’s Commission to Strengthen Social Security in 2001 would provide a minimum benefit set at 120% of the poverty line, payable to minimum-wage workers with 30 or more years of covered earnings. The Commission’s third model would provide a minimum benefit set at 100% of the poverty line for minimum-wage workers with 30 years of covered earnings, increasing to 111% of the poverty line for minimum-wage workers with 40 years of covered earnings. See President’s Commission to Strengthen Social Security, *Strengthening Social Security and Creating Personal Wealth for All Americans*, Washington, DC, December 21, 2001, [http://govinfo.library.unt.edu/csss/reports/Final\\_report.pdf](http://govinfo.library.unt.edu/csss/reports/Final_report.pdf), models 2 and 3. Other proposals with similar provisions include those provided by National Academy of Social Insurance in 2009, National Commission on Fiscal Responsibility and Reform in 2010, Representative Jason Chaffetz in 2011, the Social Security Enhancement and Protection Act of 2013 (H.R. 1374), the S.O.S. Act of 2016 (H.R. 5747), and the Rivlin-Domenici task force in 2010.

intended to address, although not resolve, concerns that providing a minimum benefit could discourage work effort. Setting eligibility for a full minimum benefit at 30 to 40 years of covered earnings would allow many workers to take several years out of the labor force to care for children (or other family members) and still receive a higher benefit than they would have qualified for in the absence of a minimum benefit. Arguably, intermittent work histories play a greater role than long-term low earnings in leading to below-poverty-level benefits among women.<sup>65</sup> Therefore, proposals for a minimum benefit based on a specified number of years of covered employment could be combined with modified spousal benefits or with a caregiver credit to balance recognition of longer work effort with recognition of the requirements of caregiving.<sup>66</sup>

To maintain the minimum benefit at a constant ratio to average living standards, some proposals would link the minimum benefit to wage growth instead of setting the minimum benefit equal to a specified percentage of the poverty line.<sup>67</sup> The official poverty line is indexed to price growth, whereas living standards rise with increases in wages and productivity. Wage growth generally outpaces price growth.<sup>68</sup>

The 2010 National Commission on Fiscal Responsibility and Reform and the Bipartisan Policy Center both proposed packages that included, among other measures, provisions to create new minimum benefits.<sup>69</sup> Some researchers propose modernizing the special minimum benefit by tying it to a poverty level that is in line with the recommendations of the National Academy of Social Insurance.<sup>70</sup> If a new minimum benefit is provided, it would be necessary to address interactions between Social Security benefits and eligibility for Supplemental Security Income, Medicaid, and other means-tested programs for low-income individuals.

---

For additional information of legislative proposals, see CRS Report R43615, *Social Security: Minimum Benefits*.

<sup>65</sup> Melissa M. Favreault, *A New Minimum Benefit for Low Lifetime Earners*, The Urban Institute: Retirement Policy Program, Washington, DC, March 2009.

<sup>66</sup> For example, the proposal provided by National Academy of Social Insurance in 2009 suggested to count up to eight years of care for children under the age of 5 as years of coverage under Minimum Benefits. Similar provisions were also proposed by National Commission on Fiscal Responsibility and Reform in 2010, Representative Jason Chaffetz in 2011, the Social Security Enhancement and Protection Act of 2013 (H.R. 1374), and the Rivlin-Domenici task force in 2010. For additional information of legislative proposals, see CRS Report R43615, *Social Security: Minimum Benefits*.

<sup>67</sup> For example, the third model proposed by the President's Commission to Strengthen Social Security would link the minimum benefit to average wage growth. See President's Commission to Strengthen Social Security, *Strengthening Social Security and Creating Personal Wealth for All Americans*, Washington, DC, December 21, 2001, [http://govinfo.library.unt.edu/csss/reports/Final\\_report.pdfm](http://govinfo.library.unt.edu/csss/reports/Final_report.pdfm), model 3. In a more recent example, the Social Security Reform Act of 2016 (H.R. 6489, 114<sup>th</sup> Congress) would have set the minimum benefits of workers with 35 years of coverage equal to 35% of the Average Wage Index (AWI).

<sup>68</sup> While projected growth in wages over time is expected to help reduce poverty among the elderly in the future (because initial monthly Social Security benefits are indexed to average wage growth), this may be offset by benefit reductions for future beneficiaries to address Social Security's projected long-range financial imbalance.

<sup>69</sup> See The National Commission on Fiscal Responsibility and Reform, *The Moment of Truth*, Washington, DC, December 2010, [http://www.fiscalcommission.gov/sites/fiscalcommission.gov/files/documents/TheMomentofTruth12\\_1\\_2010.pdf](http://www.fiscalcommission.gov/sites/fiscalcommission.gov/files/documents/TheMomentofTruth12_1_2010.pdf). Shapiro, "Enhancing Social Security for Low-Income Workers: Coordinating an Enhanced Minimum Benefit with Social Safety Net Provisions for Seniors" in *Strengthening Social Security for Vulnerable Groups*, ed. National Academy of Social Insurance (Washington, DC, 2009), pp. 27-30. The full report is available at [http://www.nasi.org/sites/default/files/research/Strengthening\\_Social\\_Security\\_for\\_Vulnerable\\_Groups.pdf](http://www.nasi.org/sites/default/files/research/Strengthening_Social_Security_for_Vulnerable_Groups.pdf).

## Caregiver Credits and Drop-out Years for Caregiving

Women are more likely than men to take career breaks to care for a child or other relative, as discussed above. The Social Security retired-worker benefit is based on the average of a worker's 35 highest years of covered earnings. If a worker has fewer than 35 years of earnings, for example due to years of unpaid caregiving, years of no earnings are entered as zeros in the computation of career-average earnings. Years of zero earnings lower the worker's career-average earnings, resulting in a lower initial monthly benefit.

One approach is to replace years of low or zero earnings with a *caregiver credit* equal to a specified dollar amount.<sup>71</sup> Some proposals would provide the same fixed credit to all eligible persons.<sup>72</sup> Other proposals would link the amount of the credit to foregone earnings, so that higher earners would receive higher credits. The latter proposal would require that the caregiver have been in the paid labor force previously. Some proposals to base benefits on caregiving, rather than on marriage, would eliminate the current spousal benefit.

A second approach is to *drop years of caregiving*, up to a fixed maximum number of years, from the benefit computation period. This approach could be implemented either by dropping years of zero earnings or by dropping years of low earnings.<sup>73</sup> The proposal to drop years of zero earnings (rather than low earnings) would require a person to leave the workforce completely. This could be problematic for many women, making the proposal less likely to reach as many women as a caregiver credit. Allowing a parent to drop up to 5 years of zero (or low) earnings for caring for a child at home would cause the parent's AIME to be calculated based on the highest 30 years of earnings, rather than the highest 35 years of earnings (the benefit computation periods would be reduced from 35 years to 30 years). This change in the benefit computation would result in higher initial monthly benefits for these workers (and higher benefits for family members who receive benefits based on their work records).

The Social Security Disability Insurance program allows up to three "drop-out" years for caregiving.<sup>74</sup> Policies to credit years of caregiving in the provision of public pension benefits have been implemented in other countries in a variety of ways. In making such a provision, one question to consider is whether the credit should be available only to parents who have stopped working completely or also to parents who continue to work part-time or full-time. Another question to consider is whether to provide credits only for the care of young children or also for the care of other immediate family members such as an aging parent. For example, Canada

<sup>71</sup> For example, see Social Security Caregiver Credit Act of 2017 (S. 1255, 115<sup>th</sup> Congress).

<sup>72</sup> See, for example, National Council of Women's Organizations and Center for Community Change, *Expanding Social Security Benefits for Financially Vulnerable Populations*, October 30, 2013, <https://iwpr.org/publications/expanding-social-security-benefits-for-financially-vulnerable-populations/>. See also U.S. Government Accountability Office, *Social Security: Options to Protect Benefits for Vulnerable Groups When Addressing Program Solvency*, GAO-10-101R, December 7, 2009, <http://www.gao.gov/products/GAO-10-101R>.

<sup>73</sup> The 1979 Advisory Council on Social Security recommended offering drop-out years scaled to the length of service, with a maximum of 6 drop-out years (as reported in: U.S. Congress, Senate Special Committee on Aging, *Summary of Recommendations and Surveys on Social Security and Pension Policies*, committee print, 96<sup>th</sup> Cong., October 1980). The National Commission on Social Security in 1981 proposed that parents be able to credit up to 10 years of child care for children under age 6 to be counted toward qualifying for the special minimum benefit (see National Commission on Social Security, *Final Report: Social Security in America's Future*, Washington, DC, March 1981).

<sup>74</sup> For more information, see CRS Report R43370, *Social Security Disability Insurance (SSDI): Becoming Insured, Calculating Benefit Payments, and the Effect of Dropout Year Provisions*. The childcare dropout year provision was authorized by the Social Security Disability Amendments of 1980 (P.L. 96-265) and became effective in July 1981. Between 2000 and 2011, SSA credited dropout years to 1,108 disabled beneficiaries representing about 0.15% of all SSDI beneficiaries during that period (source: CRS communication with SSA, December 2011).

excludes years of caring for children under the age of 7 from the averaging period in the pension calculation and from the contributory period under its earnings-related scheme, while Germany provides one pension point (equal to a year's contributions at the national average earnings) for three years per child, which can be taken by either the employed or nonemployed parent, or shared between parents (there are also credits for working while children are under the age of 10).<sup>75</sup>

Other recent proposals, however, would count additional years of earnings (more than 35 years) in the Social Security benefit computation. For example, some proposals would increase the averaging period from 35 to 38 years.<sup>76</sup> These proposals are aimed at helping improve Social Security's projected long-range financial position and at encouraging people to work longer. Such proposals generally would affect women disproportionately.

A criticism of proposals to drop or credit years of caregiving is that they may be of most benefit to higher-wage households that can afford to forego one spouse's earnings over a period of several years. Lower-wage spouses, and single working mothers, may not be in a position to stop working for any period of time. In addition, a practical issue involves ascertaining that years out of the workforce are actually spent caring for children or other family members.

## Survivor's Benefit Increased to 75% of Couple's Combined Benefit

Under current law, an aged surviving spouse receives the *higher* of his or her own retired-worker benefit and 100% of the deceased spouse's PIA. This leads to a reduction in benefits compared with the combined benefit the couple was receiving when both members of the couple were alive. The reduction ranges from one-third of the combined benefit for a one-earner couple to one-half of the combined benefit for some two-earner couples.<sup>77</sup> However, there is not always a corresponding reduction in household expenses for the surviving member of the couple. Some contend that 75% of the income previously shared by the couple more closely approximates the income needed by the surviving spouse to maintain his or her standard of living.<sup>78</sup>

One frequently mentioned proposal would increase the surviving spouse's benefit to the *higher* of (1) the deceased spouse's benefit, (2) the surviving spouse's own benefit, and (3) 75% of the couple's combined monthly benefit when both spouses were alive.<sup>79</sup> The couple's combined monthly benefit when both spouses were alive would be the sum of (1) the higher-earner's benefit and (2) the *higher* of the lower-earner's worker benefit and spousal benefit. Some proposals for a 75% survivor benefit would target the provision to lower-income households by capping the

<sup>79</sup> 1994-1996 Advisory Council on Social Security, *Report vol. 1, Findings and Recommendations*, Washington, DC, January 1997, p. 19. See also Joan Entmacher, "Strengthening Social Security Benefits for Widow(er)s: The 75 Percent Combined Worker Benefit Alternative," in *Strengthening Social Security for Vulnerable Groups*, ed. National Academy of Social Insurance (Washington, DC, 2009), pp. 23-26, available at [http://www.nasi.org/sites/default/files/research/Strengthening\\_Social\\_Security\\_for\\_Vulnerable\\_Groups.pdf](http://www.nasi.org/sites/default/files/research/Strengthening_Social_Security_for_Vulnerable_Groups.pdf); and Bipartisan Policy Center, *Securing Our Financial Future: Report of the Commission on Retirement Security and Personal Savings*, Washington, DC, June 2016, p. 97, available at <https://cdn.bipartisanpolicy.org/wp-content/uploads/2016/06/BPC-Retirement-Security-Report.pdf>.

survivor benefit, for example, at the benefit amount received by the average retired-worker beneficiary.<sup>80</sup>

A 75% minimum survivor benefit would increase benefits for many surviving spouses, both in dollar terms and as a replacement rate for the combined benefit received by the couple when both spouses were alive. For a one-earner couple, the benefit for the surviving spouse would increase from 100% to 112% of the worker's benefit ( $112\% = 75\% \text{ of } 150\% \text{ of the worker's benefit that the couple received when both spouses were alive}$ ). For a two-earner couple with similar earnings histories, the surviving spouse's benefit would increase from roughly 50% of the couple's combined benefit when both spouses were alive (under current law, the surviving spouse receives the benefit received by the higher-earning spouse while he or she was alive) to 75% of the couple's combined benefit when both spouses were alive.

A 75% minimum survivor benefit provision would “reward” the second income of a two-earner couple and improve equity between one-earner and two-earner couples. Under current law, upon the death of either spouse, the earnings record of the lower-earning spouse does not result in the payment of any additional benefits (i.e., in addition to the benefits payable on the earnings record of the higher-earning spouse). Stated another way, the earnings record of the lower-earning spouse effectively “disappears” with the death of either spouse.

Because a 75% survivor benefit would increase costs to the Social Security system, some have proposed financing it through a gradual reduction in the spousal benefit from 50% to 33% of the primary earner's benefit, while both spouses are alive.<sup>81</sup> For a one-earner couple, the couple's combined benefit would be reduced from 150% to 133% of the worker's benefit. This is broadly consistent with the structure of private annuities, where the annuity payout is lower to adjust for a longer expected payout period. As a result, more dually entitled spouses would likely qualify for a retirement benefit based on their own work record only, because more dually entitled spouses would likely have a retired-worker benefit of their own that is equal to at least 33% (rather than 50%) of the higher-earning spouse's retired-worker benefit.

Reducing a one-earner couple's combined monthly benefit to 133% of the worker's benefit, as a way to finance a 75% survivor benefit, could be problematic for low-income couples. Effectively, the increased survivor benefit would help the survivors of both one-earner and two-earner couples, but it would be financed by reducing the combined benefits of one-earner couples from 150% to 133% of the worker's benefit. In addition, unless this proposal were modified for divorced spouses, it would also reduce the spousal benefits received by divorced spouses from 50% to 33% of the primary earner's benefit. After the death of the primary earner, benefits for a divorced spouse would jump to 100% of the primary earner's benefit, creating income volatility unless this outcome is addressed for divorced spouses.

Although the 75% survivor benefit option could increase benefits for vulnerable groups such as aged widows, it would not address the needs of other vulnerable groups, such as individuals who were never married or who divorced before reaching 10 years of marriage. In addition, a 75% survivor benefit option would provide somewhat more additional benefits to higher-income beneficiaries than to lower-income beneficiaries. To address this outcome, as noted above, some proposals would cap the 75% survivor benefit at the average retired-worker benefit.

## Conclusion

Although more women have qualified for Social Security benefits based on their own earning records in recent decades, Social Security auxiliary benefits continue to play a crucial role in improving income security for older women, as well as for young surviving spouses and children of deceased workers. Some policymakers and researchers, however, have expressed concerns about the current structure of Social Security auxiliary benefits on both equity and adequacy grounds. For example, the current structure can lead to situations in which a one-earner couple receives higher retirement and survivors benefits than a two-earner couple with identical total household earnings. In addition, auxiliary benefits do not reach certain groups, such as persons who divorced before 10 years of marriage or mothers who never married.

Some proposals have been suggested to increase Social Security benefits to certain, but not all, vulnerable groups. For example, an enhanced widow(er)'s benefit would provide income support to many elderly women and men, but it would not help those who divorced before 10 years of marriage or who never married. Similarly, a caregiver credit for workers who stay at home to care for young children would increase benefits for never-married and divorced women, but it would not help those without children, whether married or unmarried.

The consideration of potential changes to Social Security spousal and survivors benefits involves balancing improvements in benefit equity, for example, between one-earner and two-earner couples, with improvements in benefit adequacy for persons who experience relatively higher poverty rates, such as never-married men and women. In addition, the policy discussion about auxiliary benefits may involve balancing benefit increases for spouses and survivors, divorced spouses, or never-married persons with other potential program changes to offset the higher program costs in light of the Social Security system's projected long-range financial outlook.<sup>82</sup>

## Appendix A. Major Changes in Social Security Auxiliary Benefits

Amendment	Type of Benefit	Amendment	Type of Benefit
<b>Retired Workers</b>		<b>Dependents of Disabled Workers</b>	
1935	Retired worker aged 65 and older	1958	Same as dependents of retired-worker recipient
1956	Retired woman aged 62-64	<b>Survivors</b>	
1961	Retired man aged 62-64	<b>Widowed Mother</b>	
<b>Disabled Workers</b>		1939	Widowed mother any age caring for eligible child
1956	Disabled worker aged 50-64	<b>Widow</b>	
1960	Disabled worker under age 65	1939	Widow aged 65 and older
<b>Dependents of Retired Workers</b>		1956	Widow aged 62-64
<b>Wife</b>		1965	Widow aged 60-61
1939	Wife aged 65 and older	1965	Divorced widow aged 60 and older
1950	Wife under age 65 caring for eligible child	1967	Disabled widow aged 50-59
1956	Wife aged 62-64	<b>Widower</b>	
<b>Child</b>		1950	Dependent widower aged 65 and older
1939	Child under 18	1961	Dependent widower aged 62-64
1956	Disabled child aged 18 and older	1967	Disabled dependent widower aged 50-61
1965	Full-time student aged 18-21	1972	Widower aged 60-61
1981	Student category eliminated except for high school students under age 19	<b>Widowed Father</b>	
<b>Husband</b>		1975 <sup>a</sup>	Widowed father caring for eligible child
<b>Divorced Wife</b>		<b>Child</b>	
1950	Husband aged 65 and older	1939	Child under age 18
1961	Husband aged 62-64	1956	Disabled child aged 18 and older
1978 <sup>a</sup>	Husband under age 65 caring for eligible child	1965	Full-time student aged 18-21
<b>Divorced Husband</b>		1981	Student category eliminated except for high school students under age 19
1965	Divorced wife age 62 and older	<b>Parent</b>	
1976 <sup>a</sup>	Divorced husband aged 62 and older	1939	Dependent parent aged 65 and older
		1956	Dependent female parent aged 62-64
		1961	Dependent male parent aged 62-64

## Appendix B. Summary of Possible Adjustments to Social Security Spousal and Widow(er)'s Benefits Under Current Law

Social Security benefits for spouses and widow(er)s are based on a percentage of the worker's *primary insurance amount* (PIA), with various adjustments for age at entitlement and other factors. The following section describes some of the adjustments that apply to benefits for spouses and widow(er)s.

### Age-Related Benefit Adjustment for Spouses

Spousal benefits (including those for divorced spouses) are reduced when the spouse claims benefits before *full retirement age* (FRA) to take into account the longer expected period of benefit receipt (assuming the individual lives to average life expectancy).<sup>83</sup> A spouse who claims benefits at the age of 62 (the earliest eligibility age for retirement benefits) may receive a benefit that is as little as 32.5% of the worker's PIA.<sup>84</sup>

### Age-Related Benefit Adjustments for Widow(er)s

The earliest age a widow(er) can claim benefits is age 60. If a widow or widower (including divorced and disabled widow(er)s) claims survivors benefits before FRA,<sup>85</sup> his or her monthly benefit is reduced by a maximum of 28.5%<sup>86</sup> to take into account the longer expected period of benefit receipt (assuming he or she lives to average life expectancy).

<sup>83</sup> Spousal benefits are reduced by 25/36 of 1% (or 0.0069) for each month of entitlement before FRA, up to 36 months, and by five-twelfths of 1% (or 0.0042) for each month of entitlement before FRA in excess of 36 months. The reduction is applied to the base spousal benefit, which is 50% of the worker's PIA. The spousal benefit is not reduced for entitlement before FRA if the spouse is caring for a qualifying child.

<sup>84</sup> For example, if the worker's PIA is \$1,000, the spousal benefit payable at the spouse's FRA is 50% of this amount, or \$500. If the spouse claims benefits at age 62 and his or her FRA is 67, the spousal benefit is reduced by 35%, from \$500 to \$325 per month. (The percent reduction for entitlement to benefits five years before FRA is found as the sum of  $(25/36) * 36$  months plus  $(5/12) * 24$  months, for a total reduction of 35%.) The spouse's benefit of \$325 is equal to 32.5% of the worker's PIA of \$1,000. The following link at the Social Security Administration's website allows users to see how timing the receipt of spousal benefits can affect benefit amounts: <http://www.ssa.gov/OACT/quickcalc/spouse.html>.

<sup>85</sup> The FRA is increasing gradually from age 65 to age 67. While the FRA for retired workers and spouses will reach age 67 for persons born in 1960 or later, it will reach age 67 for widow(er)s born in 1962 or later. The Social Security Administration provides FRAs for widow(er)s based on year of birth, plus examples of reductions for early benefit receipt, available at <https://www.ssa.gov/planners/survivors/survivorchartred.html>.

<sup>86</sup> Survivors benefits are reduced for each month of entitlement before FRA by a fraction derived by dividing 28.5% (the maximum reduction) by the number of possible months of early retirement, which is the number of months between age 60 and the person's FRA. For example, a person whose FRA is 66 could claim benefits at age 60 and potentially receive benefits for up to 72 months before FRA. The reduction for each month before FRA is therefore  $28.5\% \div 72 = 0.00396$ . As a result of this methodology, the fractions involved in reducing the widow(er)'s benefit for entitlement before FRA vary depending on the date of birth and the FRA associated with that birthdate. Survivors benefits paid from ages 50 to 59 based on a disability are not further reduced. The maximum reduction of 28.5% and the procedure for finding reduction amounts for widow(er)s who retire between age 60 and FRA are described in Social Security Administration, *Handbook*, section 724, available at [http://www.socialsecurity.gov/OP\\_Home/handbook/handbook.07/handbook-0724.html](http://www.socialsecurity.gov/OP_Home/handbook/handbook.07/handbook-0724.html).

In addition, survivors benefits may be affected by the deceased worker's decision to claim benefits before FRA. If the deceased worker claimed benefits before FRA (and therefore was receiving a reduced benefit) and the widow(er) claims survivors benefits at FRA, the widow(er)'s benefit is reduced under the *widow(er)'s limit provision*. Under the widow(er)'s limit provision, which is intended to prevent the widow(er)'s benefit from exceeding the deceased worker's retirement benefit, the widow(er)'s benefit is limited to (1) the benefit the worker would be receiving if he or she were still alive, or (2) 82.5% of the worker's PIA, whichever is higher.<sup>87</sup>

## Benefit Adjustments Based on Other Factors

Benefits for spouses and widow(er)s may be subject to other reductions, in addition to those based on entitlement before FRA. For example, under the dual entitlement rule, a Social Security spousal or widow(er)'s benefit is reduced or fully offset if the person also receives a Social Security retired-worker or disabled-worker benefit (see "Dually Entitled Beneficiaries" above). Similarly, under the *government pension offset* (GPO), a Social Security spousal or widow(er)'s benefit is reduced or fully offset if the person also receives a pension based on his or her own employment in certain federal, state, or local government positions that are not covered by Social Security.<sup>88</sup> In some cases, a spousal or widow(er)'s benefit may be reduced to bring the total amount of benefits payable to family members based on the worker's record within the maximum family benefit amount.<sup>89</sup>

Under the Social Security retirement earnings test (RET), auxiliary benefits may be reduced if the auxiliary beneficiary is below the FRA and has earnings above specified dollar thresholds. Also, under the RET, benefits paid to spouses may be reduced if the benefits are based on the record of a worker beneficiary who is affected by the RET (excluding benefits paid to divorced spouses who have been divorced for at least two years).

**Table B-1** shows the percentage of a worker's PIA on which various categories of spousal and widow(er)'s benefits are based. It also shows the age at which benefits are first payable on a reduced basis (the eligibility age) and the maximum reduction to benefits claimed before FRA relative to the worker's PIA.

<sup>87</sup> For more information, see David A. Weaver, *The Widow(er)'s Limit Provision of Social Security*, Social Security Administration, Office of Policy, Office of Research, Evaluation, and Statistics, Working Paper Series Number 92, June 2001, <http://www.socialsecurity.gov/policy/docs/workingpapers/wp92.pdf>. If the worker died before attaining FRA and he or she had benefits withheld under the retirement earnings test (RET), for purposes of determining the limit on the widow(er)'s benefit, the worker's benefit is recomputed and *increased* at the time of the worker's death to take into account months for which the worker's benefits were partially or fully withheld under the RET. For more information on the RET and how it affects benefits for survivors, see CRS Report R41242, *Social Security Retirement Earnings Test: How Earnings Affect Benefits*.

<sup>88</sup> See CRS Report RL32453, *Social Security: The Government Pension Offset (GPO)*.

<sup>89</sup> Benefits for a divorced spouse, a surviving divorced spouse or a disabled surviving divorced spouse are not reduced for the family maximum. Benefits for other auxiliaries and survivors are reduced for the family maximum not taking into account the divorced beneficiary. Social Security Administration, Program Operations Manual System (POMS), Section RS 00615.682 (Family Benefits Where a Divorced Spouse or a Surviving Divorced Spouse is Entitled), <https://secure.ssa.gov/apps10/poms.nsf/lnx/0300615682>.

**Table B-I. Social Security Spousal and Widow(er)'s Benefits**

Basis for Entitlement	Eligibility Age	Basic Benefit Amount Before Any Adjustments	Minimum Possible Benefit, Expressed as a Percent of the Worker's PIA <sup>a</sup>
<b>Spouse</b>	Age 62, or Any age if caring for the child of a retired or disabled worker. The child must be under the age of 16 or disabled, and the child must be entitled to benefits.	50% of worker's PIA	32.5% of the worker's PIA (The figure of 32.5% is found as follows. The spousal benefit is 50% of the worker's PIA. A spouse who claims benefits at age 62 and has an FRA of 67 would have his or her spousal benefit reduced by 35%, as described in footnote 84. Mathematically, the calculation is $(1-.35)*0.50$ of the retired worker's benefit = 0.325. )
<b>Divorced Spouse</b> (The divorced individual must have been married to the worker for at least 10 years before the divorce became final.)	Age 62 Must be unmarried Note: A divorced spouse who is under the age of 62 is not eligible for spousal benefits even if he/she is caring for the child of a retired or disabled worker.	50% of worker's PIA	32.5% of worker's PIA (The reduction to spousal benefits for a divorced spouse who claims benefits before FRA is identical to the reduction for a married or separated spouse.)
<b>Widowed Mothers and Fathers</b>	Surviving spouse of any age who is caring for the deceased worker's child. The child must be under the age of 16 or disabled, and the child must be entitled to benefits. Must be unmarried Must not be entitled to widow(er)'s benefits Note: In the case of a surviving divorced parent, the child must be his or her natural or legally adopted child. The 10-year marriage requirement that applies to divorced spouses under other circumstances does not apply.	75% of deceased worker's PIA	No reduction based on age at entitlement Mother's and father's benefits end if the beneficiary becomes entitled to a widow(er)'s benefit.
<b>Aged Widow(er) &amp; Divorced Widow(er)</b> (The divorced individual must have been married to the worker for at least 10 years before the divorce became final.)	Age 60 Must be unmarried (unless the marriage occurred after attainment of age 60)	100% of deceased worker's PIA <sup>b</sup>	71.5% of deceased worker's PIA (As described in footnote 86, the maximum reduction to the survivor benefit as a result of early entitlement is 28.5%. The figure of 71.5% is found as $(1-.285) * 100\%$ of the deceased worker's benefit. See also "widow(er)'s limit provision," below.)

Basis for Entitlement	Eligibility Age	Basic Benefit Amount Before Any Adjustments	Minimum Possible Benefit, Expressed as a Percent of the Worker's PIA <sup>a</sup>
<b>Disabled Widow(er) &amp; Divorced Disabled Widow(er)</b> (The divorced individual must have been married to the worker for at least 10 years before the divorce became final.)	At least age 50 (ages 50-59) Must be unmarried (unless the marriage occurred after attainment of age 50) The qualifying disability must have occurred (1) before or within seven years of the worker's death; (2) within seven years of having been previously entitled to benefits on the worker's record as a widow(er) with a child in his or her care; or (3) within seven years of having been previously entitled to benefits as a disabled widow(er) that ended because the qualifying disability ended (whichever is later). <sup>c</sup>	100% of deceased worker's PIA	71.5% of worker's PIA Disabled widow(er)s and divorced disabled widow(er)s ages 50-59 receive the same rate of reduction set for widow(er)s at age 60 (28.5% of the worker's PIA), regardless of their age at the time of entitlement.
<b>Widow(er)'s Limit Provision<sup>d</sup></b>	As noted above, widow(er)'s benefits are reduced if a widow(er) claims benefits <b>before FRA</b> , with a maximum age-related reduction equal to 28.5% of the deceased worker's PIA. If a widow(er) claims benefits <b>at FRA</b> , his or her benefits are reduced if the deceased worker (on whose record the widow(er)'s benefit is based) claimed benefits before FRA and therefore was receiving a reduced benefit. The reduction is based on the widow(er)'s limit provision. Under this provision, the widow(er)'s benefit is limited to the <i>higher</i> of: (1) the benefit the worker would be receiving if he or she were still alive, and (2) 82.5% of the deceased worker's PIA. Stated another way, under the widow(er)'s limit provision, the maximum reduction is 17.5% of the deceased worker's PIA (i.e., no less than 82.5% of the deceased worker's PIA is payable). The widow(er)'s limit provision is intended to prevent the widow(er)'s benefit from exceeding the deceased worker's retirement benefit.		
<b>Other Reductions</b>	(1) Dual Entitlement Rule: a Social Security spousal or widow(er)'s benefit is reduced or fully offset if the person also receives a Social Security retired-worker or disabled-worker benefit. (2) Government Pension Offset: a Social Security spousal or widow(er)'s benefit is reduced or fully offset if the person also receives a pension based on his or her own employment in certain federal, state or local government positions that are not covered by Social Security. (3) Retirement Earnings Test: auxiliary benefits may be reduced if the auxiliary beneficiary is below the full FRA and has earnings above specified dollar thresholds. Also, benefits paid to spouses may be reduced if the benefits are based on the record of a worker beneficiary who is affected by the RET (excluding benefits paid to divorced spouses who have been divorced for at least two years).		

**Source:** Social Security Administration, *Social Security Handbook*, Sections 418, 420 and 724, [http://www.ssa.gov/OP\\_Home/handbook/handbook.html](http://www.ssa.gov/OP_Home/handbook/handbook.html).

- a. The maximum reduction shown in this column reflects two steps: (1) computation of the spouse or widow(er) benefit as the applicable percentage (for example, 50% or 100%) of the retired or disabled worker's PIA and (2) application to the spousal or widow(er) benefit of the maximum reduction for early entitlement, assuming the spouse or widow(er) claims benefits at the earliest possible age (ages 62 and 60, respectively). For widowed mothers and fathers who have a qualified child in care, there is no reduction for entitlement before the full retirement age.
- b. A worker's claiming age affects the widow(er) benefit. If a worker is entitled (or who would have been entitled) to an increase (or subject to being increased) in their benefit amount due to claiming benefits after

- full retirement age, their benefits are increased at death to take into account the delayed retirement credits from claiming benefits after full retirement age, thereby increasing the widow(er) benefit.
- c. Benefits for disabled widow(er)s beginning at age 50 were enacted in 1967 when workers aged 50-59 needed up to seven years of covered employment to qualify for disability benefits based on their own work record.
  - d. If the worker died before reaching FRA and he or she had benefits fully or partially withheld for one or more months under the Social Security retirement earnings test (RET), for purposes of determining the limit on the widow(er)'s benefit, the deceased worker's benefit is recomputed and increased (at the time of his or her death) to take into account months for which benefits were withheld under the RET. For more information, see CRS Report R41242, *Social Security Retirement Earnings Test: How Earnings Affect Benefits*, by Dawn Nuschler.
