Timber Harvesting on Federal Lands

Congress has granted some federal land management agencies the authority to sell timber from federal lands. Two agencies, the Forest Service (FS) and the Bureau of Land Management (BLM), conduct timber sales as an authorized use. Together, the FS and the BLM manage 76% of federal forest area. FS manages 144.9 million acres, while BLM manages 37.6 million acres. The other major federal land management agencies, the National Park Service (NPS) and the Fish and Wildlife Service (FWS), rarely conduct timber sales.

Lands managed by the FS, the National Forest System (NFS), are managed under a multiple use-sustained yield model pursuant to the Multiple Use-Sustained Yield Act of 1960 (MUSYA). This statute directs FS to balance multiple uses of their lands and ensure a sustained yield of those uses in perpetuity. Congress, through the National Forest Management Act (NFMA), has directed FS to engage in long-term land use and resource management planning. Plans set the framework for land management, uses, and protection; they are developed through an interdisciplinary process with opportunities for public participation. In the case of timber, they describe where timber harvesting may occur and include measures of sustainable timber harvest levels. FS uses these plans to guide implementation of individual sales, which generate revenue. Congress has specified various uses for this revenue.

Timber harvest on FS lands has varied over time. FS harvest volumes in the 1940s were around 1-3 billion board feet per year. Annual harvest volumes rose from the 1950s through the 1980s, sometimes exceeding 10 billion board feet. Annual harvested volumes decreased in the early 1990s and have remained between 1.8 and 2.8 billion board feet since FY2003. The total dollar value of FS timber harvests generally rose from the early 1940s to over \$3 billion in FY1979. Total value has been between \$100 million and \$300 million since FY2001. From FY2014 to FY2018, the greatest average annual harvest volume on FS lands was from Oregon and Washington.

BLM lands are managed under a multiple use-sustained yield model pursuant to the Federal Land Policy and Management Act of 1976 (FLPMA). This statute directs BLM to balance multiple uses of their lands and ensure a sustained yield of those uses in perpetuity. Congress has directed BLM to engage in long-term land use and resource management planning through FLPMA. Plans set the framework for land management, uses, and protection; they are developed made through an interdisciplinary process with opportunities for public participation. In the case of timber, they describe where timber harvesting may occur and contain measures of sustainable timber harvest levels. The FS and the BLM use these plans to guide implementation of individual sales, which generate revenue. Congress has specified various uses for this revenue.

Although trends in timber activities on BLM lands are challenging to infer from the available data, volumes sold in the past appear to be larger than recent volumes offered for sale. Harvested volumes for the BLM have been between 100 and 260 million board feet annually from FY1995 onward, except in FY1994 and between FY2001-FY2003. Total harvest values have declined since the mid-1990s, and have generally been between \$20 million and \$50 million annually since FY2011. From FY2014 to FY2018, the greatest average annual harvest volume from BLM lands was from Oregon and Washington.

Congress has debated the appropriate balance of timber harvesting and other uses on federal lands. Determining the proportions of these uses, in whole and on individual lands, is challenging for land management agencies. Preferences for certain balances of these uses often stem from values about federal forests' purposes, such as consideration of economic, environmental, or recreational values. Debate has also centered on the relationship of timber harvesting levels to forest health, including whether changing harvest levels is a desirable forest management tool.

Introduction

Timber harvesting on federal lands is a long-standing activity which sometimes generates controversy. Most timber harvesting on federal lands occurs on lands directed to provide a regular output of multiple uses under current law. Determining the proportions of these uses, in whole and on individual lands, is challenging for land management agencies. Often at issue is the appropriate use of federal lands for timber harvesting under these policies, including what amount of timber harvesting should occur and what constitutes proper balance among timber harvesting and other uses.

Congress has authorized timber harvesting on certain federal lands under specified circumstances. Most timber harvesting on federal lands occurs on two land systems. The majority of harvests occur on the National Forest System (NFS), which is managed by the Forest Service (FS) within the Department of Agriculture (USDA). Harvests also occur on the public lands managed by the Bureau of Land Management (BLM) within the Department of the Interior (DOI). The FS manages 144.9 million acres of forest, while the BLM manages 37.6 million acres of forest (see **Figure 1**).¹ Together, FS and BLM forest comprises 76% of federal forest area and 23% of all forest in the United States. Within their respective forest, the FS has 96.1 million acres of timberlands, and the BLM has 6.1 million acres of timberlands. The United States has 765.5 million acres of forest, of which 514.4 million acres is timberland and 57% is private. The United States has 57.0 million acres of woodland.²

Timber harvesting is the physical cutting and removal of trees or parts of trees from a given forested site. *Harvested timber*, or cut and removed trees, is the raw material for items made of wood, such as lumber, plywood, paper, and other products. Timber harvesting may occur on private, federal, or non-federal publicly owned lands, and may be conducted by the landowner or

Forest Land, Woodland, and Timberland

Forest land, woodland, and timberland are all classifications referring to lands dominated by trees. This report, and all reported data herein, use definitions from the decennial assessment of forest resources prepared by the Forest Service as required by the Forest and Rangeland Renewable Resources Planning Act (RPA, P.L. 93-378).

Forest Land (also referred to as “forest” in this report) is defined as land with at least 10% cover by live trees, including lands that formerly had this tree cover and will be regenerated.

Timberland is defined as forest land that is producing or is capable of producing crops of industrial wood and is not withdrawn from timber use by statute or regulation. Areas qualifying as timberland are capable of producing in excess of 20 cubic feet per acre per year of industrial wood. Timberland may be *natural*, if trees are established by natural regeneration, or *planted*, if trees are established by human planting or seeding.

Woodland is defined as land with sparse trees with a tree canopy cover of 5% to 10%, combined with shrubs to achieve an overall cover of woody vegetation over 10%. Woodland is not included in the definition of timberland because woodland is not generally capable of producing the timber volumes in the definition. However, timber harvesting could occur on woodland.

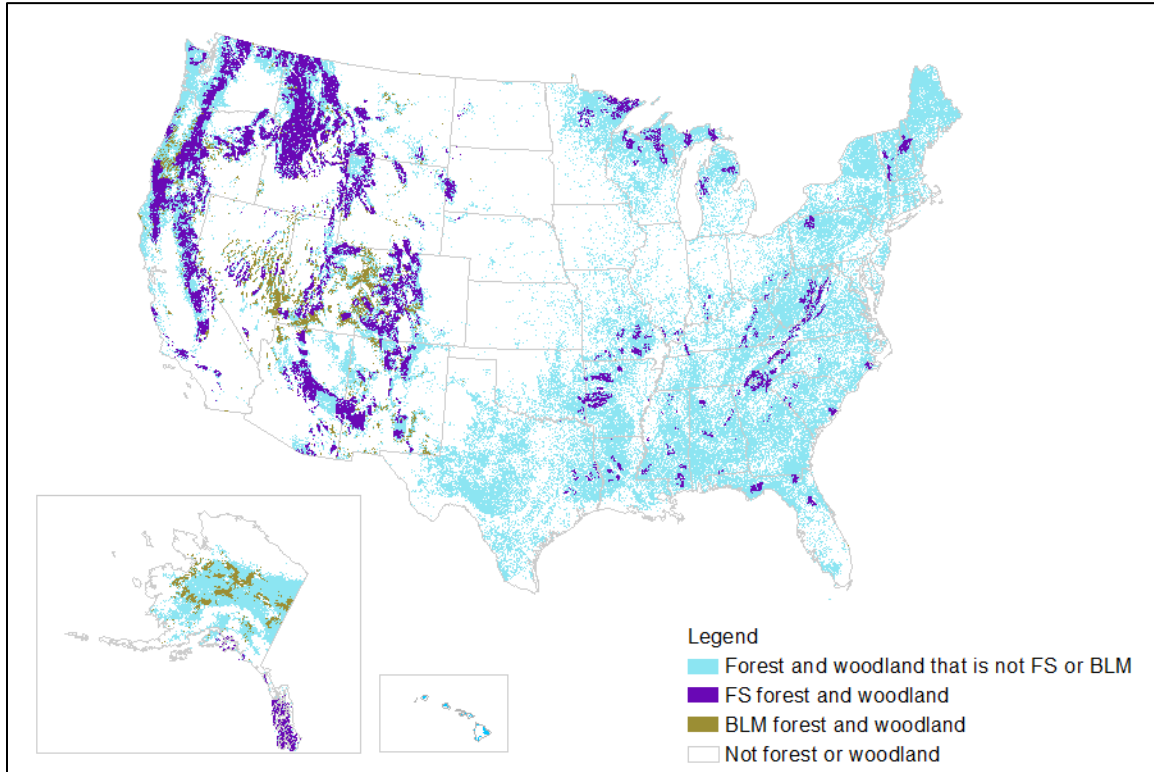

For further information regarding these definitions, see Sonja Oswald, W. Brad Smith, and Patrick Miles, et al., *Forest Resources of the United States, 2012: A Technical Document Supporting the Forest Service Update of the 2010 RPA Assessment*. U.S. Department of Agriculture (USDA), Forest Service (FS), GTR-WO-91, 2014.

¹ All following acreage data herein were generated as part of the forest and rangeland resources assessment process conducted by FS as required under the Forest and Rangeland Renewable Resources Planning Act of 1974 (RPA, P.L. 93-378). Data from Sonja Oswald, Patrick Miles, and Scott Pugh, et al., *Forest Resources of the United States, 2017: A Technical Document Supporting the Forest Service 2020 Update of the RPA Assessment*, Forest Service (FS), U.S. Department of Agriculture (USDA), 2017, https://www.fia.fs.fed.us/program-features/rpa/docs/2017RPAFIATABLESFINAL_050918.pdf, herein referred to as *RPA 2017*.

² *RPA 2017*. This source does not classify woodland by ownership.

by another entity they allow to do so. Most timber harvesting in the United States is conducted on private lands: in 2011, 88% of timber harvests were conducted on private lands, and in 2012, 90% of wood and paper products in the United States originated on private lands.³

Figure 1. FS, BLM, and Other Forest and Woodland

Source: CRS. Data from U.S. Geological Survey, Gap Analysis Program (GAP), Protected Areas Database of the United States (PAD-US), version 1.4 Combined Feature Class, 2016, and Jaketon Hewes, Brett Butler and Greg Liknes, Forest ownership in the conterminous United States circa 2014: distribution of seven ownership types - geospatial dataset. Fort Collins, CO: Forest Service Research Data Archive, 2017. Data shown are forests and woodlands.

Notes: FS and BLM land that is not forest or woodland is not depicted. Forest or woodland in all other ownership types, including private, public nonfederal, and federal non-FS and non-BLM ownership, is depicted in blue.

FS and BLM conduct *timber sales* as the most general way to allow timber harvesting on their respective lands, although they may allow harvesting in other ways.⁴ A timber sale is a formal process whereby an entity may purchase a contract to cut and remove specified timber. FS and BLM receive revenue from the sale of the contract. Information on timber harvesting in this report, such as harvested volume, harvested value, and other statistics, derives from FS and BLM data and may include timber harvested through timber sales or other means.

³ Sonja Oswald, W. Brad Smith, and Patrick Miles, et al., *Forest Resources of the United States, 2012: A Technical Document Supporting the Forest Service Update of the 2010 RPA Assessment*. FS, USDA, GTR-WO-91, 2014, and Sonja Oswald and W. Brad Smith, *U.S. Forest Resource Facts and Historical Trends*, FS, USDA, FS-1035, 2014.

⁴ For general authorities regarding timber sales on FS and BLM land, see “Statutory Authorities for Harvesting Timber” in the FS and BLM sections. A detailed discussion of specific authorities allowing FS to sell or otherwise dispose of timber through various vehicles, or in specified circumstances, is beyond the scope of this report.

Both FS and BLM timber sale planning and implementation proceed under similar principles of achieving multiple use and sustained yield. Both agencies conduct timber harvesting for various purposes. Both plan long-term timber management by designating areas that can support sustainable timber harvest and calculating yields that can be taken without permanent impairment. In the short term, both agencies create plans for timber sales, determine the value of offered timber and specify what timber may be cut, and conduct sales in a competitive manner open to the public.⁵

Timber harvesting may also occur on two other federal land systems, the National Park System, managed by the National Park Service, and the National Wildlife Refuge System (NWRS), managed by the Fish and Wildlife Service (both agencies are within DOI). In the case of the National Park System, the Secretary may dispose of timber to control insects and diseases or to conserve natural or historic resources.⁶ In the case of the NWRS, the Secretary of the Interior may permit timber harvesting to achieve desired fish and wildlife habitat conditions. On both systems, timber harvesting is rare, and harvested volumes are small.⁷

This report provides an overview of timber harvesting on FS and BLM lands. The report describes general statutory authorities and regulations, planning activities, timber sales, and trends in the volume and value of timber harvested, first from FS lands, and then for BLM lands.⁸ It concludes with a discussion of issues Congress has debated concerning timber harvesting and federal lands.

The National Forest System

The National Forest System comprises nearly 193 million acres. It is made up of 154 national forests, national grasslands, and other units such as research and experimental areas.⁹ Approximately 75% of national forest acreage is located in 15 states.¹⁰ As discussed, the NFS contains 144.9 million acres of forest and woodland, of which 66% are considered timberland.¹¹

⁵ For greater detail, see FS and BLM “Planning Rules and Process” sections. Some agency authorities and resources describe this process; for BLM, see 43 C.F.R. §5410 and BLM Handbook H-5410-1, *Annual Forest Product Sale Plan*; for FS, see *FS Manual 2431.04, Management of Timber Sale Program*.

⁶ 54 U.S.C. §100753.

⁷ For an overview of general purposes, authorities, and organization of the NWRS and the different units of the NPS, see respectively CRS Report R45265, *U.S. Fish and Wildlife Service: An Overview*, by R. Eliot Crafton, and CRS Report R41816, *National Park System: What Do the Different Park Titles Signify?*, by Laura B. Comay.

⁸ Unless otherwise specified, this report discusses harvested volume, also called cut volume, and harvested value, also called cut value. Harvested volume refers to the amount of timber physically removed in a given period of time. Volume of timber harvested in a given year typically differs from timber sold or timber offered for sale in that year. Harvested value refers to the amount paid for the cut timber after it is removed.

⁹ FS, USDA, *Land Areas Report (LAR)*, 2018, Table 1, at <https://www.fs.fed.us/land/staff/lar/LAR2018/LARTable01.pdf>.

¹⁰ These states are FS regions 1 through 6, which includes the states of Arizona, California, Colorado, Idaho, Kansas, Montana, Nebraska, Nevada, New Mexico, North Dakota, Oregon, South Dakota, Utah, Washington, and Wyoming.

¹¹ Data from RPA 2017. For more information on the NFS, see CRS Report R43872, *National Forest System Management: Overview, Appropriations, and Issues for Congress*, by Katie Hoover.

Statutory Authorities for Harvesting Timber

Most of the lands contained in the modern Forest Service were reserved from the public lands in the late 19th and early 20th centuries, in what were first called “forest reserves”.¹² The forest reserves were initially managed by the DOI and later moved to the USDA and the Forest Service.¹³ Through the Organic Administration Act, Congress specified that the purpose of these forests was to “improve and protect the forest within the reservation . . . and to furnish a continuous supply of timber for the use and necessities of the citizens of the United States,” in addition to protecting water flows.¹⁴ The act authorized timber sales of “dead, matured or large growth of trees” and set out procedures for conducting them.¹⁵

Congress expanded the purposes for the national forests, and developed management goals to achieve those purposes, through the Multiple Use-Sustained Yield Act of 1960 (MUSYA).¹⁶ Congress added the provision of fish and wildlife habitat, recreation, energy and mineral development, and livestock grazing as official purposes of the national forests, in addition to timber harvesting and watershed protection. To supply these activities, management of the forests’ resources is to be organized for multiple uses in a “harmonious and coordinated” manner that considers the combination of uses that best meets the needs of the American people, not that necessarily yields the largest dollar return or output. The act also directs a sustained yield of products and services, meaning high-level regular output in perpetuity without impairing the lands’ productivity.¹⁷

Planning, Sale Process, and Revenues

Congress has directed FS to engage in long-term land use and resource management. Plans set the framework for land management, uses, and protection. They are developed through an interdisciplinary process with opportunities for public participation. FS uses these plans to guide implementation of site-specific activities. In the case of timber, plans describe where timber harvesting may occur and include measures of sustainable timber harvest levels, and are used to

¹² Congress granted the President the authority to establish forest reserves from lands in the public domain through the Forest Reserve Act of March 3, 1891, P.L. 51-561. Congress repealed the President’s authority to establish forest reserves in certain states through the Agriculture Appropriations Act of March 4, 1907 (PL. 60-242) and renamed the forest reserves “national forests”. Congress repealed the President’s authority to establish national forests altogether with the passage of the National Forest Management Act of 1976 (NFMA, P.L. 94-588; see “Planning, Sale Process, and Revenues” in the FS section below). For example, in 1910, national forests comprised 172 million acres. See FS, USDA, *Land Areas Report (LAR)*, 2018, Table 21 for data on historical NFS acres.

¹³ The Transfer Act of 1905 (33 Stat. 628, 16 U.S.C. §472) moved management of these lands to the Bureau of Forestry in the USDA. Secretary of Agriculture James Wilson changed the name of the Bureau of Forestry to the Forest Service through General Order No. 84, issued February 1, 1905. U.S. Congress, Senate, *Rules and Regulations governing the Department of Agriculture in its various branches*, Furnished in response to a resolution adopted by the Senate of the United States, prepared by Government Printing Office, 59th Cong., 2nd sess., 398 (Washington: GPO, 1907).

¹⁴ Act of June 4, 1897, Organic Administration Act, hereinafter referred to as the FS Organic Act (16 U.S.C. 473-476); timber authorization in seventh and ninth paragraphs under “Surveying the Public Lands”. The Act was amended by the National Forest Management Act of 1976, described below in the FS “Planning, Sale Process, and Revenues” section.

¹⁵ While the FS Organic Act provides a general authorization for harvesting timber, other laws have provided specific authorities. For example, salvage sale authority was provided in the National Forest Management Act, P.L. 94-588, among others. Detailed description of special authorities is beyond the scope of this report.

¹⁶ P.L. 86-517, 16 U.S.C. §528 et seq.

¹⁷ 16 U.S.C. §531b.

guide implementation of individual sales. These sales generate revenues. Congress has specified various uses for these revenues.

Congress directed the Forest Service to conduct long-term planning and management through the passage of the National Forest Management Act of 1976 (NFMA).¹⁸ NFMA requires the FS to prepare a land and resource management plan—often called a “forest plan”—for each NFS unit.¹⁹ These plans are to be revised at least every 15 years. The FS has issued regulations to implement the planning requirement—often called “planning rules”—and to establish the procedures for developing, amending, and revising forest plans. The first planning rule was issued in 1979 and later revised; the current rule dates from 2012.²⁰ Forest planning and implementation generally proceed as described below. Forest Service timber planning and administration proceed under general FS planning procedures.²¹

Forest plans guide management of the plan area by specifying objectives, standards, and guidelines for resources and activities. They contain certain components required by statute, such as components addressing provision of outdoor recreation, range, wildlife, fish, and timber. Among the most general required components addressing timber are requirements to identify areas and quantities for timber harvesting.²² The FS must identify lands that may be *not suited for timber production*.²³ All other lands in the NFS unit are considered suitable for timber production. The plan must contain the *allowable sale quantity*, the measure of timber that can be removed annually without impairing future yield, although FS also considers other measures of sustainable yield in planning over various time horizons.²⁴ The allowable sale quantity informs the amount of timber that can be removed annually over a ten-year plan period.²⁵ Plans are required to be developed with public participation and in accordance with various other administrative and environmental statutes, such as the National Environmental Policy Act (NEPA).²⁶

¹⁸ P.L. 93-378 P.L. 94-588, 16 U.S.C. §1601 et al. (NFMA). NFMA amended the Forests and Rangelands Renewable Resources Planning Act (RPA), P.L. 93-378, 16 U.S.C. §§1600 et seq.

¹⁹ NFS units may consist of more than one national forest.

²⁰ 36 C.F.R. § 221. For greater detail on the history of the planning rule, see CRS Report R43872, *National Forest System Management: Overview, Appropriations, and Issues for Congress*, by Katie Hoover; see also Forest Service, “History of Forest Planning,” <https://www.fs.usda.gov/main/planningrule/history>.

²¹ Information in this section derives from a general survey of selected FS laws, regulations, and other authorities, such as manuals and handbooks. For FS timber planning and administration authorities, see 16 U.S.C. §472a, 16 U.S.C. §1611, 16 U.S.C. §1604, 36 C.F.R. §219, 36 C.F.R. §221, 36 C.F.R. §223, FS Manual Series 1900, FS Manual Series 2400, FS Handbook 1901.12, FS Handbook Series 2400. In general, if a cited activity is addressed in statute, statute is cited, although other authorities may exist (for example, in regulation or agency handbooks, manuals, or other directives); if a cited activity is addressed in regulations, regulations are cited, although other authorities may exist (for example, in agency handbooks, manuals, or other directives); if a cited activity is addressed in agency handbooks, manuals, or other directives, at least one such authority is cited.

²² Statutes also require other components addressing timber harvesting in forest plans, such as components addressing circumstances wherein harvest levels may be increased based on intensified management practices, or components addressing circumstances under which harvests to regenerate even-aged stands may be used, among others. See, for example, 16 U.S.C. §1600(g)(3)(D-F), 16 U.S.C. §1600(m).

²³ The FS removes from consideration lands that cannot legally be harvested due to executive or legislative action, are not forested, have other desired conditions established in planning, or will be difficult to restock or damaging to harvest. 16 U.S.C. §1604(k).

²⁴ 16 U.S.C. §1611(a).

²⁵ See FS Handbook 1901.20, Chapter 60, *Forest Vegetation Resource Management*, FS, Manual 2410, *Timber Resource Management Planning*, and FS, FS Handbook 2409.13, *Timber Resource Planning Handbook* for a description of other concepts FS may use in planning for short- and long-term sustainable yield.

²⁶ P.L. 91-190, 42 U.S.C. §§4321-4347; for an overview of NEPA, see CRS Report RL33152, *The National*

Forest plans may consider harvesting for various purposes—for example, to produce timber or to achieve and maintain desired resource conditions, such as habitat improvement, fire risk reduction, and sanitation.²⁷ If the forest plan identifies lands as suitable for timber production, the plan must address timber harvesting on those lands.²⁸ If the forest plan considers timber harvesting for purposes other than producing timber, it must delineate areas where such activities may occur. These areas may be identified by forest type, geographic area, or other criteria.²⁹

FS conducts timber sales to achieve the objectives in the forest plan. FS establishes a sale schedule and timber sale project plan, which may include more than one timber sale.³⁰ The plan estimates volume offered, acreage, and harvest methods for the relevant sales. Site-specific timber harvests must also comport with NEPA and relevant statutes, including any requirement for site-specific environmental analysis and review.

Prior to an individual sale, FS marks and appraises the timber to be offered. FS may designate timber in one of three ways: physical marking, a written description of specific trees for harvest (called *description*), or a written description of desired post-harvest stand characteristics (called *prescription*).³¹ FS creates a sale package, including a prospectus, sample contract, and other required documentation; some requirements are site-specific.³² FS advertises the package at an appraised starting price.³³ Interested parties may bid on the package. A contract is awarded to the highest bidder provided legal conditions are met.³⁴ The winning bidder conducts the timber harvest according to the terms—such as timeline, harvest method, and road construction conditions—specified in the contract. Timber harvests must generally be completed in 3 years, with a maximum term of 10 years.³⁵

Timber sales generate revenue, and disposition of this revenue depends on several factors. Congress has established several funds for FS to retain and use timber sale receipts. Depending on the type of sale, among other factors, FS may be required to make certain deposits to these funds. If any portion of receipts are not required to be deposited, FS may distribute receipts among funds at their discretion, including depositing all revenue in a single fund. The money in these funds may be used by the FS for a variety of purposes, sometimes without further appropriation (i.e., as mandatory appropriations).³⁶ See **Table A-1** for a list of these funds. ³³ 16 U.S.C. §472a(d).

³⁴ 16 U.S.C. §472a(e).

³⁵ 16 U.S.C. §472a(c).

³⁶ For information on FS funds and receipts, see the “Revenue, Receipts, and Transfers” section of the annual FS Budget Justifications, e.g., p. 17 of the FY2020 Budget Justification at https://www.fs.fed.us/sites/default/files/media_wysiwyg/usfs-fy-2020-budget-justification.pdf. FS allocates some revenues to entities as required under revenue-sharing programs, generally states or local governments. The relationship between allocation of revenue in this manner and deposits into timber revenue funds is determined by law. A detailed discussion of this topic is beyond the scope of this report. For more information on some revenue-sharing

detailed discussion of revenue levels, expenditures, and issues related to FS timber revenue funds is outside the scope of this report.

Timber Harvests from the NFS

Timber harvesting is one of many authorized uses of the NFS. The amount of timber harvested from the NFS, and its relative proportion of total U.S. timber supply, has fluctuated over time. This section provides an overview of timber volume harvested from the NFS, and value of those harvests, along with some economic and historical factors which may have contributed to observed changes.

The volume of timber harvested from the national forests (and their precursors, the forest reserves) increased slowly from 1898 until the 1940s.³⁷ Most demand for wood was met by private timberlands; by 1940, for example, FS lands supplied 2% of U.S. timber supply.³⁸

In the post-World War II era, timber harvest volume from the NFS grew (see **Figure 2**).³⁹ The timber supply from private forestry was unable to keep pace with the increased demand, due in part to high harvest levels during WWII.⁴⁰ In the 1950s, the FS began to raise harvest limits.⁴¹ Harvests rose from 1-3 billion board feet (abbreviated BBF) annually in the early 1940s to more than 10 BBF in some years of the 1960s and 1970s.⁴² According to historical data from one source, harvest from the NFS rose from 9% of total U.S. harvest in 1952 to 16% in 1962 and 1970, and 15% in 1976.⁴³

Harvest volume declined from the mid-1970s to the early 1980s. Harvest on FS lands shifted to more marginal timberlands; in part, clear-cutting in the previous decades had reduced tree volume available for harvest in productive areas.⁴⁴ This period also coincided with recessions in 1980 and 1982, which may have reduced demand.

programs, see CRS Report RL31392, *PILT (Payments in Lieu of Taxes): Somewhat Simplified*, by Katie Hoover, and CRS Report R41303, *Reauthorizing the Secure Rural Schools and Community Self-Determination Act of 2000*, by Katie Hoover.

³⁷ For more information about the FS before 1940, see Paul Hirt, *A Conspiracy of Optimism: Management of the National Forests since World War Two* (Lincoln, NE: University of Nebraska Press, 1994).

³⁸ Terry West, *Centennial Mini-Histories of the Forest Service*, USDA, Report FS-518, 1992. See also Miles Burnett and Charles Davis, "Getting Out the Cut: Politics and National Forest Timber Harvests, 1960-1995." *Administration & Society*, vol. 34, no. 2 (2002): pp. 202-228.

³⁹ Deborah Che, "The new economy and the forest: rural development in the post-industrial spaces of the rural Alleghenies," *Social Science Quarterly* vol. 84, no. 4, (2003) pp. 963-978.

⁴⁰ Miles Burnett and Charles Davis, "Getting Out the Cut: Politics and National Forest Timber Harvests, 1960-1995." *Administration & Society*, vol. 34, no. 2 (2002): pp. 202-228; Paul Hirt, *A Conspiracy of Optimism: Management of the National Forests since World War Two* (Lincoln, NE: University of Nebraska Press, 1994).

⁴¹ For example, according to FS, *Report of the Chief of the Forest Service*, 1953 and 1961, measures of sustainable allowable cut were estimated to be at least 6.9 billion board feet (BBF) in 1953, and 11.2 BBF in 1961; in 1961, authors reported a "steady increase in the annual allowable cut in recent years."

⁴² A board foot is a unit of wood measuring 12 inches by 12 inches by 1 inch.

⁴³ Calculation from historical national forest timber harvest data and historical U.S. timber harvest data presented in Richard Haynes (Technical Coordinator), *An Analysis of the Timber Situation in the United States: 1952 to 2050*, FS, USDA, PNW-GTR-560, 2003. Historical data presented in this source are from 1952, 1962, 1970, 1976, 1986, 1991, and 1997. Data were compiled as part of the forest and rangeland resources assessment process conducted by FS as required under the Forest and Rangeland Renewable Resources Planning Act of 1974 (RPA, P.L. 93-378). They may differ from other assessments of historical timber harvesting if differences exist in the data generating process.

Figure 2. Annual Cut Volume and Value, NFS

Source: CRS. FY1977-FY2018 data: Forest Service, *Forest Products Cut and Sold Reports*, <https://www.fs.fed.us/forestmanagement/products/cut-sold/index.shtml>. FY1940-FY1976 data: Forest Service Legislative Affairs Office.

Notes: MMBF stands for million board feet. 1,000 million board feet equals 1 billion board feet. Nominal dollars have been converted to FY2018 dollars using Bureau of Labor Statistics Historical Consumer Price Index, All Urban Customers, annual averages.

Timber harvests rose from the early 1980s to the early 1990s, sometimes reaching levels of over 12 BBF per year. These timber harvests coincided with the 1986 U.S. peak in per capita consumption of wood products, driven in part by an increase in housing starts following the 1982 recession.⁴⁵ In 1986, timber harvests from the NFS were 13% of total U.S. timber harvests.

In the early 1990s, harvested timber volume began a sustained decrease. In 1991, the NFS supplied 11% of total U.S. harvested timber, and in 1997, the NFS supplied 5% of total U.S. harvested timber.⁴⁶ In 2011, NFS supplied 2% of U.S. wood and paper products.⁴⁷ Numerous interrelated factors, including statutory, administrative, biological, and market influences, may have contributed to this decline. The effect of each individual factor is not settled, as is the effect of each factor over time. These factors occurred at varying points in time and may not coincide directly with observed harvest level changes. Some sources have noted that statutory changes added complexity to forest management and increasing litigation frequency, while also increasing transparency and public participation.⁴⁸ Other sources have noted changing management

⁴⁵ James Howard and Kwameka Jones, *U.S. Timber Production, Trade, Consumption, and Price Statistics, 1965-2013*, USDA, FPL-RP-679, 2016.

⁴⁶ Calculation from historical national forest timber harvest data and historical U.S. timber harvest data presented in Richard Haynes (Technical Coordinator), *An Analysis of the Timber Situation in the United States: 1952 to 2050*, FS, USDA, PNW-GTR-560, 2003.

⁴⁷ Sonja Oswald, W. Brad Smith, and Patrick Miles, et al., *Forest Resources of the United States, 2012: A Technical Document Supporting the Forest Service Update of the 2010 RPA Assessment*. Forest Service (FS), U.S. Department of Agriculture (USDA), GTR-WO-91, 2014

⁴⁸ For a historical perspective of FS timber administration, and a description of changes following the enactment of

priorities.⁴⁹ Others have noted decreasing domestic demand, volatile prices, and the prevalence of less valuable timber due to high harvest levels in previous decades.⁵⁰ The listing of the northern spotted owl (*Strix occidentalis caurina*) under the Endangered Species Act in 1990 is often discussed in regard to declining timber harvest levels.⁵¹

Harvested volumes have consistently been between 2 BBF and 3 BBF annually from FY2004 onward. In FY2018, approximately 2.8 BBF were harvested from FS lands. Although the national timber market in the United States was affected by the 2008 housing market collapse and the subsequent decline in demand, timber volumes harvested from FS experienced relatively little change in volume, for unclear reasons.⁵²

In FY2018 dollars, harvest values from approximately FY2000 onward are similar to harvest values in the early 1940s. Harvest values generally increased from the early 1940s to a peak of approximately \$3.4 billion (FY2018 dollars) in FY1979, before a decline through FY1982. They rose again thereafter, reaching another peak of approximately \$2.6 billion (FY2018 dollars) in FY1989, before again declining. Values from FY2001 onward have generally been between approximately \$100 million and \$300 million in FY2018 dollars. In FY2018, cut value was approximately \$188.8 million. FS harvest value declined during the recession and housing collapse of 2008. Harvest value may vary due to quality, species, and age class of offered timber and timber market conditions, and is correlated with volume harvested.

Geographic Distribution of Timber Harvests from NFS Lands

FS harvest volume differs by region; these differences mirror the major production regions in private forestry (see **Figure 3**). FS Region 6 (the Pacific Northwest), Region 8 (the Southeast),

statutes such as NFMA, see Herbert Kaufman, *The Forest Ranger: A Study in Administrative Behavior* (Johns Hopkins Press, 1967), Terence Tipple and J. Douglas Wellman, "Herbert Kaufman's Forest Ranger Thirty Years Later: From Simplicity and Homogeneity to Complexity and Diversity," *Public Administration Review* 51(5), 1991, pp. 421-428, and Paul Hirt, *A Conspiracy of Optimism: Management of the National Forests since World War Two* (Lincoln, NE: University of Nebraska Press, 1994). For FS analysis of the effect of procedural requirements on NFS management, see USDA, FS, *The Process Predicament: How Statutory, Regulatory, and Administrative Factors Affect NFS Management*, 2002. For a description of some changes to FS litigation patterns over time, see Robert Malmshiemer, Denise Keele, and Donald W. Floyd, "National Forest Litigation and the U.S. Court of Appeals," *Journal of Forestry*, vol. 10, no. 20 (2004), pp. 20-25, and Amanda Miner, Robert Malmshiemer, and Denise Keele, "Twenty Years of Forest Service Land Management Litigation," *Journal of Forestry*, vol. 112, no. 1 (2014), pp. 32-40.

⁴⁹ For example, see Dale Bosworth and Hutch Brown, "After the Timber Wars: Community-Based Stewardship," *Journal of Forestry*, vol. 105, no. 5 (2007), p. 271, and George Hoberg, "The Emerging Triumph of Ecosystem Management: The Transformation of Federal Forest Policy," in *Western Public Lands and Environmental Politics*, ed. Charles David, 2nd ed. (Routledge, 2018), pp. 55-86.

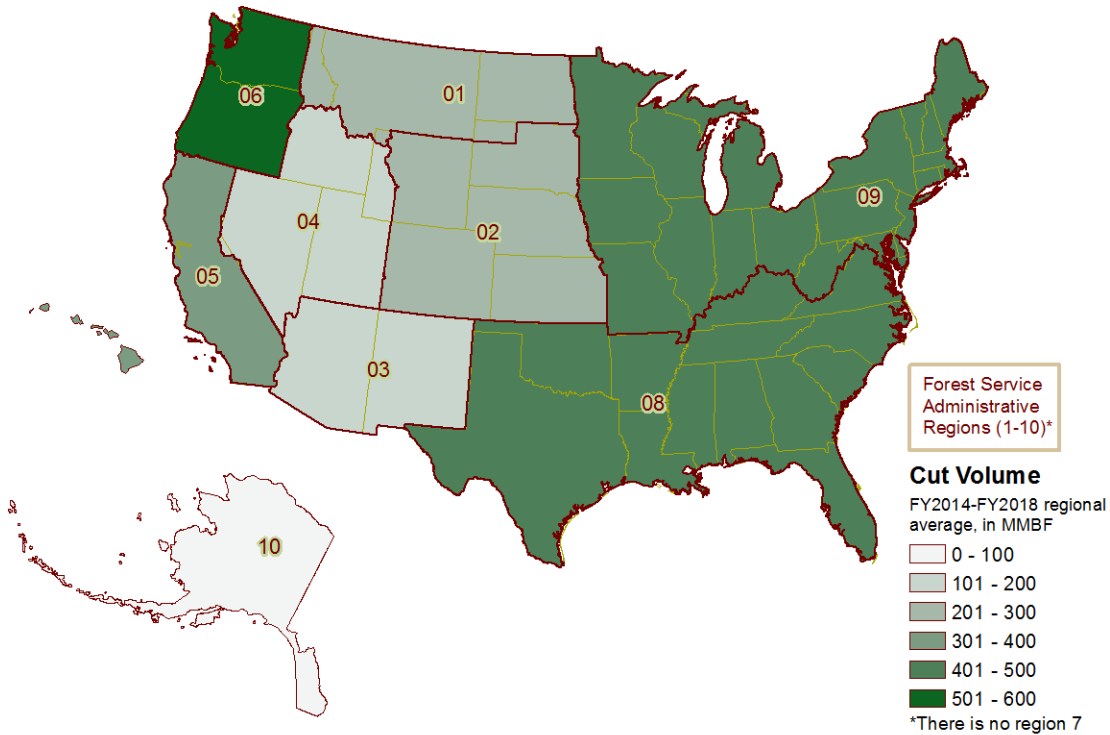

⁵⁰ For information on market changes over time, see James Howard and Kwameka Jones, *U.S. Timber Production, Trade, Consumption, and Price Statistics, 1965-2013*, USDA, FPL-RP-679, 2016; Sonja Oswald, W. Brad Smith, and Patrick Miles, et al., *Forest Resources of the United States, 2012: A Technical Document Supporting the Forest Service Update of the 2010 RPA Assessment*. FS, USDA, GTR-WO-91, 2014; and Paul Hirt, *A Conspiracy of Optimism: Management of the National Forests since World War Two* (Lincoln, NE: University of Nebraska Press, 1994). For perspectives on the relationship between timber availability and timber harvest trends before 2000, see Roger Sedjo (ed.), *A Vision for the Forest Service: Goals for Its Next Century* (Washington, DC: 2000).

⁵¹ See Steven Lewis Yaffee, *The Wisdom of the Spotted Owl: Policy Lessons for a New Century* (Washington, DC: Island Press, 1994) for a history of the listing of the spotted owl. For more information on the Endangered Species Act, see CRS Report RL31654, *The Endangered Species Act: A Primer*, by Pervaze A. Sheikh.

⁵² The national timber market includes demand and supply from public and private sources. The housing industry is the single largest consumer of wood products in the United States. For an overview of U.S. timber consumption, including discussion of timber consumption by sector, see James Howard and Kwameka Jones, *U.S. Timber Production, Trade, Consumption, and Price Statistics, 1965-2013*, USDA, FPL-RP-679, 2016.

and Region 9 (the North), are the three largest producing regions in both private and public forestry.⁵³ In general, harvest volume and value by region is a function of many complex factors, including the dominant timber type, age class, and condition; the suitability of FS sites for harvest operations; the legal limitations on land uses; and the status of the local forest products industry.

Figure 3. Average Annual Cut Volume by NFS Region, FY2014-FY2018

Source: CRS. Calculation from Forest Service, *Forest Products Cut and Sold Reports*, <https://www.fs.fed.us/forestmanagement/products/cut-sold/index.shtml>.

Notes: MMBF = million board feet. The FS refers to its regions by number, as labeled above. FS Region 7, the North Central, was merged with FS Region 9, the Eastern, in 1965. The new region is referred to as Region 9, the Eastern Region, and there is currently no Region 7. Average annual cut volume is reported by NFS region; average annual cut volume differs for each state and cannot be inferred from a regional average.

Bureau of Land Management Lands

The Bureau of Land Management (BLM) administers about 246 million surface acres of federal lands, almost entirely located in twelve western states.⁵⁴ As noted, about 37.6 million acres of BLM lands are forest; of that, 16% is considered timberland.⁵⁵ The Oregon and California (O&C) lands, which comprise approximately 2.6 million acres, contain 2.4 million acres of forest (see

⁵³ James Howard and Kwameka Jones, *U.S. Timber Production, Trade, Consumption, and Price Statistics, 1965-2013*, USDA, FPL-RP-679, 2016.

⁵⁴ The twelve states are Alaska, Arizona, California, Colorado, Idaho, Montana, Nevada, New Mexico, Oregon, Utah, Washington, and Wyoming. BLM lands in these states comprise 99% of BLM lands.

⁵⁵ *RPA 2017*.

“Statutory Authorities for Harvesting Timber,” below, for a description of the O&C lands).⁵⁶ The transfer of the forest reserves to FS administration in the early 1900s reduced the amount of forest land and timberland under BLM management today.

Statutory Authorities for Harvesting Timber

The modern BLM was formed in 1946 to manage the public domain lands.⁵⁷ At its formation, BLM had no general authority to harvest timber on those lands.⁵⁸ Congress authorized BLM to dispose of forest materials through the Materials Act of 1947.⁵⁹ Congress later elaborated BLM’s management responsibilities with the passage of the Federal Land Policy and Management Act of 1976 (FLPMA).⁶⁰ Like the MUSYA’s mandate for the FS, FLPMA requires BLM to manage the public lands for multiple use and sustained yield in a “harmonious and coordinated” manner that considers the combination of uses that best meets the needs of the American people, not necessarily yields the largest dollar return or output. The act directs a sustained yield of renewable resources, meaning high-level regular output in perpetuity without impairing the lands’ productivity.⁶¹

The O&C lands are lands in western Oregon managed according to their own establishing statutes, mostly by BLM. FS manages 492 thousand acres of the O&C lands, or 18% of this total area. The lands consist of several areas, the Oregon and California lands and the Coos Bay Wagon Road (CBWR) lands, which were reverted to the federal government following violation of grant terms.⁶² They are usually referred to collectively as “O&C lands” and often grouped for legislative purposes. BLM or FS’s mandate to sell timber on the O&C lands derives directly from the O&C lands’ establishing statute. The O&C Act directs that O&C lands be managed for sustained yield of permanent forest production, watershed protection, recreation, and contributing to the economic stability of local communities and industries.⁶³

Planning, Sale Process, and Receipts

Congress has directed BLM to engage in long-term land use and resource management planning. Plans set the framework for land management, uses, and protection. They are developed through an interdisciplinary process with opportunities for public participation. BLM uses these plans to guide implementation of site-specific activities. In the case of timber, plans describe where timber

⁵⁶ BLM, DOI, *BLM Facts: Oregon-Washington*, 2017.

⁵⁷ 60 Stat. 1097, 5 U.S.C. §403.

⁵⁸ For more information on BLM authorities at its formation, see Paul W. Gates, *History of Public Land Law Development*, written for the Public Land Law Review Commission (Washington, DC: GPO, November 1968), pp. 610-622 ; and James Muhn, Hanson R. Stuart, and Peter D. Doran, *Opportunity and Challenge: The Story of BLM* (Washington, DC, 1998).

⁵⁹ 61 Stat. 681, 30 U.S.C. §§601-604. While the Materials Act provides a general authority to conduct timber sales, other special authorities exist: for example, the salvage sale authority provided in the Interior and Related Agencies Appropriations Act for FY1993 (P.L. 102-391). Detailed description of these special authorities is beyond the scope of this report.

⁶¹ 43 U.S.C. §1702e(h).

⁶² The CBWR lands were established by 40 Stat. 1179, which is not classified in the *U.S. Code*. The Oregon and California lands were established by 50 Stat. 874; 43 U.S.C. §§ 2601-2634. For a more detailed history of the lands, see CRS Report R42951, *The Oregon and California Railroad Lands (O&C Lands): Issues for Congress*, by Katie Hoover, and BLM, *O&C Sustained Yield Act: the Land, the Law, the Legacy*, http://www.blm.gov/or/files/OC_History.pdf.

⁶³ 50 Stat. 874; 43 U.S.C. § 2601.

harvesting may occur and include measures of sustainable timber harvest levels. They are used to guide execution of individual sales, which generate revenues. Congress has specified various uses for these revenues.

BLM timber planning and administration follow general BLM land use planning procedures.⁶⁴ Through FLPMA, Congress directs BLM to develop, maintain, and revise plans for managing public lands. BLM issued the first regulations to implement the planning requirement in 1979, and subsequently revised them; the current BLM planning rule dates from 2005.⁶⁵ Plans must be developed with public participation and in accordance with various other administrative and environmental statutes (e.g., NEPA).⁶⁶

Under BLM's planning rule, resource management plans remain in effect indefinitely. They are to include monitoring and evaluation standards, and are to be amended or revised when circumstances warrant.⁶⁷ The planning rule directs BLM to identify indicators that describe the desired forest outcomes in the plan area. BLM is to identify a suite of management actions to achieve those outcomes, including identifying *sustained yield areas*, areas that could support long-term timber harvest.⁶⁸ BLM personnel determine a harvest level for these areas that can be maintained without permanent impairment; this harvest level is known as the *allowable sale quantity*.⁶⁹ Allowable sale quantity is measured for a ten-year period.⁷⁰

In addition, BLM generally makes annual forest product sale plans.⁷¹ These plans contain estimates of sale volume, acreage, and permitted harvest methods for any sales proposed for the year.⁷² Site-specific timber harvests must comport with NEPA and relevant statutes, including any additional requirement for site-specific analysis and review.

To conduct an individual sale within the plan, BLM designates the timber for sale and appraises the value of the timber.⁷³ BLM timber may be designated by physical marking or by enclosing timber in a sale boundary.⁷⁴ BLM prepares a sale contract, along with a prospectus describing the

⁶⁴ Information in this section derives from selected BLM law, regulation, and other authorities, such as manuals and handbooks. For BLM timber planning and administration authorities, see 43 U.S.C. § 1701 et seq, 43 U.S.C. §§ 2601, 43 C.F.R. § 1601.0-1601.8, 43 C.F.R. § 5003.1-5511.5, BLM Manual Series MS-5000 through MS-5420, BLM Manual MS-1601, BLM Handbook 5000 Series, and BLM Handbook H-1601-1. In general, if an activity is addressed in statute, statute is cited, although other authorities may exist (for example, in regulation or agency handbooks, manuals, or other directives); if an activity is addressed in regulations, regulations are cited, although other authorities may exist (for example, in agency handbooks, manuals, or other directives); if an activity is addressed in agency handbooks, manuals, or other directives, at least one such authority is cited.

⁷⁴ BLM Manual M-5420, *Preparation for Sale*.

sale.⁷⁵ The sale is advertised at an appraised starting price.⁷⁶ Interested parties may bid on the contract. A contract is awarded to the highest bidder provided legal conditions are met.⁷⁷ The winning bidder conducts the timber harvest according to the terms specified in the contract, such as timeline and harvest method. Timber harvests must generally be completed in three years, but may be extended under certain circumstances.⁷⁸

Timber sales generate revenues, and disposition of these revenues depends on a number of factors. Congress has established several funds for timber sale revenues. Depending on the type of sale and the originating lands, BLM may be required to make certain deposits to these funds. If any portion of revenues are not required to be deposited, BLM may allocate those revenues among funds at its discretion, including depositing all revenues in a single account. Some funds are permanently appropriated to BLM and may be used without further congressional action (i.e. as mandatory appropriations).⁷⁹ See **Table A-2** for a list of these funds. A more detailed discussion of funding levels, expenditures, and issues related to BLM timber revenue funds is outside the scope of this report.

Timber Harvests from BLM Lands

Timber harvesting is one of many authorized uses of BLM lands. Long-term historical data regarding BLM timber harvesting is unavailable. Other data on past timber program activity show that BLM timber harvesting may have changed over time. This section provides data on timber offered for sale, timber sold, and timber harvested from BLM lands at various points in time, along with some economic and historical factors which may have contributed to observed changes.

Data on cut timber volume from BLM lands is available from FY1994 onward (see **Figure 4**). While complete historical cut data is unavailable prior to FY1994, some data exists about past sales (see **Table 1**). The intermittent nature of this data challenges drawing conclusions about larger trends in these periods, especially in the missing decades. In addition, these data refer to either timber sold or timber offered for sale, which differs from volume of timber cut.⁸⁰ However, as an approximate comparison, the data show that the volumes sold prior to FY1990 are large compared to recent volumes offered for sale. Observers confirmed a decline in public domain

⁷⁵ 43 C.F.R. §§5430.0-1. A prospectus is a descriptive document describing the sale in greater detail than the advertisement, but in less detail than the contract. It is available to interested bidders on request.

⁷⁶ 43 C.F.R. §§5430.0-1.

⁷⁷ 43 C.F.R. §§5440-5450.

⁷⁸ 43 C.F.R. §5463.1, 43 C.F.R. §5473

⁷⁹ For information on BLM funds and receipts, see the annual BLM Budget Justifications on the Department of the Interior's Budget Office website, e.g., <https://www.doi.gov/budget/appropriations/2020>. BLM allocates some revenues to entities as required under revenue-sharing programs. BLM allocation of revenue is determined by law, including law pertaining to individual funds and activities. A detailed discussion of this topic is beyond the scope of this report. For more information on some revenue-sharing programs, see CRS Report RL31392, *PILT (Payments in Lieu of Taxes): Somewhat Simplified*, by Katie Hoover, and CRS Report R41303, *Reauthorizing the Secure Rural Schools and Community Self-Determination Act of 2000*, by Katie Hoover.

⁸⁰ Volume of timber offered for sale, volume of timber sold, and volume of timber cut typically differ in a given year. Volume of timber offered for sale differs from volume of timber sold in that not all offered sales may be completed. Both differ from timber cut for a number of reasons. For example, purchasers may have a period of several years to cut timber, they may not fully execute the cut specified in the contract, or disturbances may alter volume between the time the sale is made and the harvest is executed.

timber offered for sale beginning in 1991, though the investigation did not consider the O&C lands.⁸¹

Table I. BLM Timber Sales, Historical

Fiscal Year	Timber Volume Sold (MMBF)	Timber Volume Offered for Sale (MMBF)
1948	431.8	NA
1951	499.5	NA
1960	359.8	NA
1970	1787.5	NA
1980	1196.8	NA
1990	1221.8	NA
2000	NA	277.8
2010	NA	92.5

Source: CRS. Sum of timber volume sales from public lands and O&C lands found in *Report of the Director, 1948*; *Report of the Director, 1951*; *Statistical Appendix, Annual Report, 1960*; and for each of *Public Land Statistics, 1970*; *Public Land Statistics, 1980*; *Public Land Statistics, 1990*; *Public Land Statistics, 2000*; and *Public Land Statistics, 2010*.

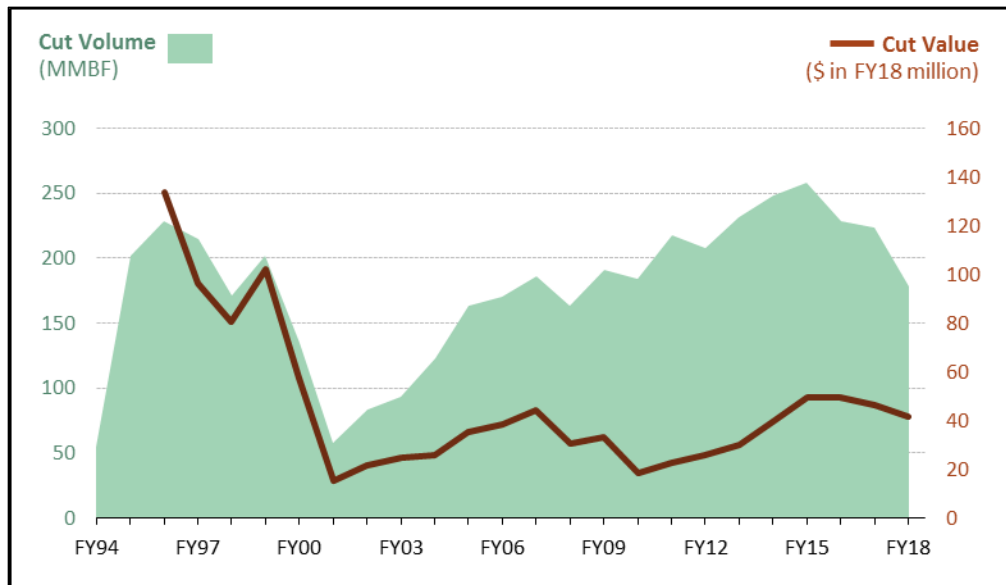

Notes: These data report either volume of timber offered for sale, or volume of timber sold. Volume of timber offered for sale differs from volume of timber sold in that not all offered sales may be purchased. Thus, volume of timber offered for sale is generally greater than volume of timber sold. BLM data sources reported timber volume sold in 1948, 1951, 1960, 1970, 1980, and 1990. BLM data sources reported timber offered for sale in 2000 and 2010. “NA” means data were not reported in that year.

Volumes harvested from BLM lands were between 100 and 260 MMBF from FY1995 to FY2000 and from FY2004 to FY2018 (see **Figure 4**). Harvests were lower in FY1994 and between FY2001 and FY2003. Harvested volumes have shown a generally increasing trend since FY2001, with the largest recently recorded harvest in FY2015 (about 258 MMBF). Like the NFS, harvests from BLM lands during the recession and housing market collapse of 2008 experienced relatively little change in volume, for unclear reasons. In FY2018, BLM harvested about 178 MMBF.

Data on cut timber value from BLM lands is available from FY1996 onward (see **Figure 4**). Total value of harvests has declined since FY1996. Harvest values have generally increased since the low value of approximately \$15.4 million in FY2001, and have been between \$20 million and \$50 million since FY2011 (FY2018 dollars). In FY2018, cut value was \$41.3 million. Like the FS, BLM harvest value during the recession and housing market collapse of 2008 declined, but the relative change was small compared to the decreases of the late 1990s. Harvest value may vary due to the quality, species, and age class of offered timber as well as timber market conditions, and is correlated with harvested volume. BLM harvest values per unit of timber are higher than FS values per unit, due to the dominant timber type harvested from BLM lands, among other factors.⁸²

⁸¹ U.S. General Accounting Office, *BLM Public Domain Lands: Volume of Timber Offered for Sale Has Declined Substantially since Fiscal Year 1990*, GAO-03-615, June 2003.

⁸² The great majority of timber harvested from BLM land is from the O&C lands (see “Geographic Distribution of”). O&C lands are dominated by Douglas fir (*Pseudotsuga menziesii*), a species used extensively for timber.

Figure 4. Annual Cut Volume and Value, BLM

Source: CRS. FY2012-FY2018 data: BLM, Bureau Wide Timber Data, *Transaction Reports*, <https://www.blm.gov/programs/natural-resources/forests-and-woodlands/timber-sales/bureau-wide-timber-data>. FY1994-FY2011 cut volume data and FY1996-FY2011 cut value data: personal communication between BLM legislative affairs office and CRS, December 14, 2018.

Notes: Complete historical cut volume data is unavailable prior to FY1994, and complete historical cut value data is unavailable prior to FY1996. MMBF stands for million board feet. Nominal dollars have been converted to FY2018 dollars using Bureau of Labor Statistics Historical Consumer Price Index, All Urban Customers, annual averages.

Geographic Distribution of Timber Harvests on BLM Lands

Most timber harvests on BLM lands are conducted on the O&C lands. From FY2014 to FY2018, the average harvested volume from O&C lands was 93% of the average total volume. The large proportion of volume harvested from O&C lands reflects the forest cover and type, dominant use for forest production, and the size of the forest industry in the Pacific Northwest.⁸³ As with the NFS, in general, BLM harvest volume and value is a function of many complex factors, including the dominant timber type, age class, and condition; the suitability of sites for harvest operations; legal limitations on land uses; and the status of the local forest products industry.

Issues for Congress

Management of federal lands for multiple uses and sustained yield is challenging, including balancing timber harvesting with other uses. Timber production from federal lands is driven by a complex interaction of environmental factors, market forces, and land management policies. Under current law, efforts to change harvest levels must comport with the provision of a sustained yield of multiple uses. Congress has sometimes considered legislation to prioritize or exclude some uses in a limited manner—in certain geographic regions, for example—but has not changed these fundamental management concepts since their enactment in the 1960s and 1970s.

⁸³ The largest forest producing regions in the United States are the Pacific Northwest and the Southeast. The BLM does not manage any forestland in the Southeast.

The public often expresses preferences for uses of federal forests, including with respect to timber harvesting. Some may support timber harvesting generally, and believe the current levels of production are sufficient. Others may wish to see the levels of production increased or decreased, depending on their perspective. Those who support timber harvesting on federal lands may cite benefits to the local timber industry, a belief that harvesting is part of the core mission of federal forests, or a belief that timber harvesting is a tool for improving forest health conditions, among other reasons.⁸⁴ Proponents of timber harvesting on federal lands may also emphasize the role of timber harvesting in some forest-adjacent rural economies.⁸⁵ Others may oppose timber harvesting due to concerns about ecological or human impacts: for example, they may cite beliefs that timber sales have detrimental impacts on environmental quality, fish and wildlife habitat, forest character, recreation and tourism, or cultural and aesthetic values.⁸⁶ Opponents may also contend that conducting timber sales favors the timber industry over other interests.⁸⁷

In addition to the themes identified above, Congress may also debate other issues related to federal timber harvests that are not discussed in detail in this report. For example, these include issues related to the disposition and use of timber sale revenues; the relationship between timber harvest planning and statutes such as NEPA and the Endangered Species Act (ESA); and special harvest authorities, among others.

⁸⁴ See Roger Sedjo, *The Future of the Forest Service*, Property and Environment Research Center, Vol. 36, No. 1, 2017; Greg Brown, "Relationships between spatial and non-spatial preferences and place-based values in national forests," *Applied Geography*, vol. 44 (2013), pp. 1-11; and Greg Brown and Pat Reed, "Validation of a forest values typology for use in national forest planning," *Forest Science*, vol. 46, no. 2 (2000), pp. 240-247.

⁸⁵ For example, see U.S. Congress, Senate Committee on Energy and Natural Resources, *Improving Forest Health and Socioeconomic Opportunities on the Nation's Forest System*, 114th Cong., 1st sess., 2015, S. Hrg. 114-262 (Washington: GPO, 2016).

⁸⁷ See, for example, Mike Garrity, "Taxpayer subsidized logging makes no sense," *Helena Independent Record*, (2014).

Appendix. Timber Receipt Funds

The following tables list and describe the funds that receive timber sale revenues; the funds' statutory authority is also shown. A detailed discussion of funding levels, expenditures, and issues related to these funds is outside the scope of this report.

Table A-1. Timber Revenue Funds: Forest Service

Name	Description	Authority
Brush Disposal	FS determines an amount for each sale, above the stumpage price for the sale, to be deposited in this permanently appropriated account. Money in the fund may be used to dispose of brush and debris from harvesting within the sale area.	Act of August 11, 1916; 16 U.S.C. §490.
Credits for Purchaser-Built Roads	Purchasers elect for FS to build the permanent roads required in a sale contract, and make deposits to this permanently appropriated fund. The FS uses the money in the fund to build the required roads.	National Forest Management Act, P.L. 94-588; 16 U.S.C. §472a(i).
Knutson-Vandenberg (K-V) Fund	The act authorizes FS to retain revenue collected from NFS timber sales in a permanent fund appropriated to the FS. Congress initially authorized use of K-V funds to finance reforestation, non-commercial thinning, and other improvements on the sale site. Subsequent action by Congress has expanded the K-V fund's authorized uses for other forest and renewable resource projects, and extended the eligible spending area to the FS region of the sale. Reforestation of the sale site is required to make K-V Fund deposits.	Knutson-Vandenberg Act, PL 71-319, as amended; 16 U.S.C. 576-576b.
Salvage Sale Fund	Revenue from a timber sale with any salvage component may be placed in this fund, which is permanently appropriated to FS. Money in the fund must be used to conduct other salvage sales.	National Forest Management Act, P.L. 94-588; 16 U.S.C. §472a(h).

Name	Description	Authority
Stewardship Contracting Fund	FS may enter into stewardship contracts to achieve land management goals and to apply the value of any harvested timber against the cost of those stewardship services. Timber revenue above the cost of stewardship services is deposited in this fund and is authorized to be used for other stewardship projects or to cover liabilities from canceled sales.	Healthy Forests Restoration Act (HFRA), P.L. 108-148, as amended; 16 U.S.C. §6591c.
Timber Sales Pipeline Restoration Fund	Revenues from certain timber sales, and from additional sales prepared using the fund, are permanently appropriated to FS. Of the available money, 75% is allocated to prepare additional timber sales, and the other 25% is for recreation projects. ^a	Omnibus Consolidated Rescissions and Appropriations Act of 1996, P.L. 104-134 § 327; 16 U.S.C. §1611 note.

Source: CRS. Table compiled using FS budget justifications from FY2010 onward; and David C. Powell, U.S. Department of Agriculture, Forest Service, *Fact Sheet: Forest Service Trust Funds*, FS White Paper FI4-SO-WP-SILV-17, Umatilla National Forest, Pendleton OR, last updated February 2014.

Notes: Funds are listed in alphabetical order by name of fund.

- a. The sales were originally made under the Interior and Related Agencies Appropriations Act for FY1990 (P.L. 101-121) but were halted in 1992 due to a new Endangered Species Act listing in the region of the sales. The sales were reinstated under the 1995 Emergency Supplemental Appropriations and Rescissions Act (P.L. 104-19 § 327). Prior to the passage of the Omnibus Consolidated Rescissions and Appropriations Act of 1996, which authorized the Timber Sales Pipeline Restoration Fund, revenues from the reinstated sales were disposed of as general timber receipts.

Table A-2. Timber Revenue Funds: Bureau of Land Management

Type of Land	Name	Description	Authority
Public Domain Lands	Reclamation Fund	In 17 western states, a portion of revenues from timber sales on public domain lands are deposited in this fund. ^a Expenditures require an annual appropriation, and are typically for water infrastructure projects.	Reclamation Act of June 17, 1902; 43 U.S.C. §391.
Public Domain & O&C Lands	Forest Ecosystem Health and Recovery Fund	After payments to states and to O&C counties, up to 100% of the federal share of receipts from sales designated as salvage sales are permanently appropriated to BLM to prepare and administer more salvage sales.	Interior and Related Agencies Appropriations Act for FY1993; P.L. 102-391.

Type of Land	Name	Description	Authority
Public Domain Lands & O&C Lands	Stewardship Contracting Excess Receipts	BLM may enter into stewardship contracts to achieve land management goals and to apply the value of any harvested timber against the cost of those stewardship services. Timber receipts above the cost of stewardship services are deposited in this fund and are authorized to be used for other stewardship projects or to cover liabilities from canceled sales.	Healthy Forests Restoration Act (HFRA), P.L. 108-148, as amended; 16 U.S.C. §6591c.
Public Domain Lands & O&C Lands	Timber Sales Pipeline Restoration Fund	Receipts from certain timber sales, and from additional sales prepared using the fund, are permanently appropriated to the BLM after payments to counties. Of the available money, 75% is allocated to prepare additional timber sales, and the other 25% is for recreation projects. ^b	Omnibus Consolidated Rescissions and Appropriations Act of 1996, P.L. 104-134 § 327; 16 U.S.C. §1611.

Notes: Funds are listed by the applicable lands. For each set of applicable lands, they are listed in alphabetical order by name of fund.

- a. The 17 states are all states west of the Mississippi, except Alaska and Hawaii. Although statute specifies that monies received from 17 states are to be deposited in the fund, 99% of BLM land is located in 12 of those states. For more information on the Reclamation Fund, see CRS In Focus IF10042, *The Reclamation Fund*, by Charles V. Stern
- b. The sales were originally made under the Interior and Related Agencies Appropriations Act for FY1990 (P.L. 101-121) but were halted in 1992 due to a new Endangered Species Act listing in the region of the sales. The sales were reinstated under the 1995 Emergency Supplemental Appropriations and Rescissions Act (P.L. 104-19 § 327). Prior to the passage of the Omnibus Consolidated Rescissions and Appropriations Act of 1996, which authorized the Timber Sales Pipeline Restoration Fund, receipts from the reinstated sales were disposed of as general timber receipts.

EveryCRSReport.com

The Congressional Research Service (CRS) is a federal legislative branch agency, housed inside the Library of Congress, charged with providing the United States Congress non-partisan advice on issues that may come before Congress.

EveryCRSReport.com republishes CRS reports that are available to all Congressional staff. The reports are not classified, and Members of Congress routinely make individual reports available to the public.

Prior to our republication, we redacted phone numbers and email addresses of analysts who produced the reports. We also added this page to the report. We have not intentionally made any other changes to any report published on EveryCRSReport.com.

CRS reports, as a work of the United States government, are not subject to copyright protection in the United States. Any CRS report may be reproduced and distributed in its entirety without permission from CRS. However, as a CRS report may include copyrighted images or material from a third party, you may need to obtain permission of the copyright holder if you wish to copy or otherwise use copyrighted material.

Information in a CRS report should not be relied upon for purposes other than public understanding of information that has been provided by CRS to members of Congress in connection with CRS' institutional role.

EveryCRSReport.com is not a government website and is not affiliated with CRS. We do not claim copyright on any CRS report we have republished.
