Patent-Eligible Subject Matter Reform in the 116th Congress

Kevin J. Hickey
Legislative Attorney

September 17, 2019
Patent-Eligible Subject Matter Reform in the 116th Congress

The statutory definition of patent-eligible subject matter under Section 101 of the Patent Act has remained essentially unchanged for over two centuries. As a result, the scope of patentable subject matter—that is, the types of inventions that may be patented—has largely been left to the federal courts to develop through “common law”-like adjudication. In the 20th century, the U.S. Supreme Court established that three main types of discoveries are categorically patent-ineligible: laws of nature, natural phenomena, and abstract ideas.

Recent Supreme Court decisions have broadened the scope of these three judicial exceptions to patent-eligible subject matter. Over a five-year period, the Supreme Court rejected, as ineligible, patents on a business method for hedging price-fluctuation risk; a method for calibrating the dosage of a particular drug; isolated human DNA segments; and a method of mitigating settlement risk in financial transactions using a computer. These cases established a new two-step test, known as the Alice/Mayo framework, for determining whether a patent claims ineligible subject matter.

The first step of the Alice/Mayo test addresses whether the patent claims are “directed to” a law of nature, natural phenomenon, or abstract idea. If not, the invention is patentable. If the claims are directed to one of the ineligible categories, then the second step of the analysis asks whether the patent claims have an “inventive concept.” To have an inventive concept, the patent claim must contain elements that transform the nature of the claim into a patent-eligible application of the ineligible concept, so that the claim amounts, in practice, to something “significantly more” than a patent on the ineligible concept itself. If the invention fails the second step of Alice/Mayo, then it is patent-ineligible.

The Supreme Court’s decisions have been widely recognized to effect a significant change in the scope of patentable subject matter, restricting the sorts of inventions that are patentable in the United States. The Alice/Mayo test has been the subject of criticism, with some stakeholders arguing that the Alice/Mayo framework is vague and unpredictable, unduly restricts the scope of patentable subject matter, reduces incentives to invest and innovate, and harms American industry’s competitiveness. In particular, the Alice/Mayo test has created uncertainty in the computer technology and biotechnology industries as to whether innovations in medical diagnostics, personalized medicine, methods of treatment, computer software, and artificial intelligence are patent-eligible.

As a result, some patent law stakeholders, including academics, bar associations, industry representatives, judges, and former Patent and Trademark Office (PTO) officials, have called for the Supreme Court or Congress to act to change the law of patentable subject matter. However, other stakeholders defend the legal status quo, arguing that the Alice/Mayo framework provides an important tool for combating unmeritorious patent litigation, or that the revitalized limits on patentable subject matter have important benefits for innovation.

Recently, there have been several substantial administrative and legislative efforts to clarify or reform patent-eligible subject matter law. In January 2019, the PTO issued revised guidance to its patent examiners with the aim of clarifying and improving predictability in how PTO patent examiners make Section 101 determinations. In April and May of 2019, a bipartisan and bicameral group of Members released draft legislative proposals that would abrogate the Alice/Mayo framework and transform the law of Section 101 and related provisions of the Patent Act. Following a series of hearings in June 2019, many expect a bill to reform Section 101 to be introduced this fall.

These proposed changes could have significant effects as to the types of technologies that are patentable. The availability of patent rights, in turn, affects incentives to invest and innovate in particular fields, as well as consumer costs and public access to technological innovation. Understanding the legal background and context can aid Congress as it debates the legal and practical effects that legislative Section 101 reforms would have if enacted.

The statutory language governing patent-eligible subject matter—that is, the types of inventions that may be patented—has remained remarkably constant over the nearly 250-year history of U.S. patent law. Under the Patent Act of 1793, which Thomas Jefferson authored, “any new and useful art, machine, manufacture or composition of matter, or any new and useful improvement [of the same]” was patentable. Current law—Section 101 the Patent Act of 1952—permits the patenting of “any new and useful process, machine, manufacture, or composition of matter, or any new and useful improvement thereof.” Through these four expansive statutory categories, Congress sought to ensure that nearly “anything under the sun made by man” is patentable if it meets all the requirements for patentability, such as novelty, enablement, and nonobviousness.

Consistent with the broad statutory language, Section 101 permits patenting in fields of applied technology such as pharmaceuticals, biotechnology, chemistry, computer hardware and software, electrical engineering, agriculture, mechanical engineering, and manufacturing processes. However, the Supreme Court has long read Section 101 to categorically prohibit patents on three types of discoveries: “laws of nature, natural phenomena, and abstract ideas.” Even if “not required by the statutory text” of Section 101, the Court has held that these three judicial

1 See generally Diamond v. Chakrabarty, 447 U.S. 303, 308-09 (1980) (tracing the history of statutory language on patentable subject matter). This observation—and this report more generally—is limited to traditional utility patents on useful inventions and discoveries. See 35 U.S.C. §§ 100-135. Congress did not provide patent protection for “original and ornamental designs for an article of manufacture” (design patents), id. §§ 171-173, and for “distinct and new variety[es] of plants” (plant patents), id. §§ 161-164, until 1842 and 1930, respectively. See An Act in addition to an act to promote the progress of the useful arts, and to repeal all acts and parts of acts heretofore made for that purpose, Pub. L. No. 27-263, 5 Stat. 543 (1842); An Act to provide for plant patents, Pub. L. No. 71-245, 46 Stat. 376 (1930).

5 Chakrabarty, 447 U.S. at 308 (“In choosing such expansive terms as ‘manufacture’ and ‘composition of matter,’ modified by the comprehensive ‘any,’ Congress plainly contemplated that the patent laws would be given wide scope.”).

7 See 35 U.S.C. §§ 102-103, 112; see generally infra “Requirements for Patentability.”

9 Diehr, 450 U.S. at 185.
exceptions “define[] the reach of the statute as a matter of statutory stare decisis going back 150 years.”

In a recent series of decisions, the Supreme Court relied on Section 101 to reject patent claims on

- a method for hedging price-fluctuation risks in commodity markets;11
- a method for measuring metabolites in human blood for the purpose of calibrating the dosage of particular drug;12
- isolated human DNA segments;13 and
- a method of mitigating settlement risk in financial transactions using a computer.14

These decisions established a two-step test for patentable subject matter sometimes called the “Alice/Mayo test” or the “Alice/Mayo framework.”15 These cases have been widely recognized to effect a significant change in the scope of patentable subject matter, restricting the sorts of inventions that are patentable in the United States.16 The Alice/Mayo framework has thus shifted, for better or worse, the balance between providing incentives to innovate and the social costs of exclusive rights that is at the heart of patent law.17 The effects of this change have been particularly pronounced in the fields of computer technology and biomedical technology.18

As a result, there is a significant and ongoing debate about the effects of Alice/Mayo framework, with a number of patent law stakeholders raising concerns about recent patentable subject matter rulings.19 Critics argue that the Alice/Mayo framework is vague, unpredictable, and not administrable;20 muddies patent law by confusing patent eligibility with distinct patent law

11 Bilski, 561 U.S. at 611-12.
17 See Bonito Boats, Inc. v. Thunder Craft Boats, Inc., 489 U.S. 141, 146 (1989) (“From their inception, the federal patent laws have embodied a careful balance between the need to promote innovation and the recognition that imitation and refinement through imitation are both necessary to invention itself and the very lifeblood of a competitive economy.”); Mark A. Lemley, Property, Intellectual Property, and Free Riding, 83 TEX. L. REV. 1031, 1031 (2005) (“Traditionally, the proper goal of intellectual property law is to give as little protection as possible consistent with encouraging innovation.”).
18 See PTO PSM REPORT, supra note 16, at 34-35 (finding “a general consensus that two industries have been most directly affected by the recent Supreme Court jurisprudence: life sciences and computer-related technologies”).
19 See generally id. at 27-34 (summarizing public comments that the Alice/Mayo framework is legally flawed, overly broad, unpredictable, and harmful to innovation).
20 Id. at 29-30 (describing public views that the Supreme Court “has failed to articulate objective, predictable criteria” for patentable subject matter); Hon. Paul R. Michel, The Supreme Court Saps Patent Certainty, 82 GEO. WASH. L. REV. 1751, 1758 (2014) (criticizing Court’s recent Section 101 jurisprudence as “subjective,” “indeterminate,” and “highly
concerns, such as nonobviousness;\textsuperscript{21} reduces incentives to innovate and invest in particular industries, such as biotechnology;\textsuperscript{22} or puts the U.S. industry at a disadvantage with respect to international competitors.\textsuperscript{23} Other stakeholders defend the Alice/Mayo framework, arguing that the Court’s recent decisions are a part of the ordinary common law development of Section 101;\textsuperscript{24} an important tool for combating unmeritorious litigation\textsuperscript{25} or preventing overbroad or otherwise harmful patents;\textsuperscript{26} or beneficial to American consumers by lowering prices.\textsuperscript{27}

In response to the concerns of some stakeholders, there have been several significant recent administrative and legislative developments that aim to clarify and/or reform the law of Section 101. On January 7, 2019, the Patent and Trademark Office (PTO) issued Revised Patent Subject Matter Eligibility Guidance designed to assist PTO patent examiners in determining patent eligibility with greater clarity and predictability.\textsuperscript{28} On April 17, 2019, Senators Thom Tillis and Chris Coons, along with Representatives Doug Collins, Hank Johnson, and Steve Stivers, released a “bipartisan, bicameral framework” for legislative Section 101 reform.\textsuperscript{29} On May 22, 2019, the Senate Judiciary Committee heard testimony on the need for Section 101 reform.

\textsuperscript{21} See PTO PSM Report, supra note 16, at 31-32; Michael Risch, Everything Is Patentable, 75 TENN. L. REV. 591, 598-606 (2008) (arguing that patentability criteria such as obviousness, novelty, utility, inventorship, written description, and enablement motivate the Supreme Court’s patentable subject matter decisions); but see Mark A. Lemley et al., Life After Bilski, 63 STAN. L. REV. 1315, 1319-32 (2011) (arguing that the preemption/overbreadth concerns driving Section 101 are distinct from disclosure and definiteness concerns under Section 112).

\section*{Patent Law Background}

to ensure that it meets all the applicable legal requirements to merit the grant of a patent.\textsuperscript{37} To be patentable, an invention must be (1) directed at patent-eligible subject matter, (2) useful, (3) new, (4) nonobvious, and (5) adequately disclosed and claimed in the patent application.\textsuperscript{38} If the PTO finds these requirements met, it will issue (i.e., grant) the patent.\textsuperscript{39} Patents typically expire 20 years after the date of the initial patent application.\textsuperscript{40}

The current law of patent-eligible subject matter will be discussed separately in detail below.\textsuperscript{41} The remainder of this section briefly reviews the other requirements for patentability, the scope and effect of patent claims, and the legal rights granted to the holder of a valid patent.

**Requirements for Patentability**

**Section 101: Utility**

In addition to subject matter requirements, Section 101 also contains a requirement that a patented invention must be “useful.”\textsuperscript{42} In particular, courts have held that an invention must have both a specific and substantial utility to be patentable.\textsuperscript{43} The utility requirement derives from the Constitution’s command that patent laws exist to “promote the Progress of . . . useful Arts.”\textsuperscript{44} The constitutional purpose of patent law thus requires a “benefit derived by the public from an invention with substantial utility,” where the “specific benefit exists in currently available form.”\textsuperscript{45} This standard for utility is relatively low, however, requiring only that the claimed invention have some “significant and presently available benefit to the public” that “is not so vague as to be meaningless.”\textsuperscript{46}

**Section 102: Novelty**

Perhaps the most fundamental requirement for patentability is that the claimed invention must be new. Specifically, the PTO will not issue a patent if “the claimed invention was patented, described in a printed publication, or in public use, on sale, or otherwise available to the public before the effective filing date of the claimed invention.”\textsuperscript{47} In other words, if every limitation of the claimed invention is already disclosed in the “prior art”—the information available to the public at the time of the patent application—then the alleged inventor “has added nothing to the total stock of knowledge,” and no valid patent may issue to her.\textsuperscript{48}

Section 103: Nonobviousness

Even if a claimed invention is novel in the narrow sense that it is not “identically disclosed” in a prior-art reference (such as an earlier patent or publication), the invention must further be nonobvious to be patentable. Specifically, an invention cannot be patented if “the differences between the claimed invention and the prior art are such that the claimed invention as a whole would have been obvious . . . to a person having ordinary skill” in the relevant technology. When determining obviousness, courts may evaluate considerations such as “commercial success, long felt but unsolved needs, [or] failure of others . . . to give light to the circumstances surrounding the origin of the subject matter sought to be patented.” By its nature, obviousness is an “expansive and flexible” inquiry that cannot be reduced to narrow, rigid tests. Nonetheless, if an invention merely combines “familiar elements according to known methods,” yielding only “predictable results,” it is likely to be obvious.

Section 112(a): Written Description, Enablement, Best Mode

Finally, the Patent Act imposes several requirements relating to the technical disclosures in the patent application. These provisions are intended to ensure that the patent adequately describes the invention such that the public can use the invention after the expiration of the patent term. Section 112(a) of the Patent Act requires that patents must contain a “specification” that includes:

- a written description of the invention, and of the manner and process of making and using it, in such full, clear, concise, and exact terms as to enable any person skilled in the art to . . . make and use the same, and shall set forth the best mode contemplated by the inventor or joint inventor of carrying out the invention.

This statutory language yields three basic disclosure requirements for patentability. First, to satisfy the written description requirement, the specification must “reasonably convey[] to those skilled in the art that the inventor had possession of the claimed subject matter as of the filing date” of the patent application. Second, to satisfy the enablement requirement, the specification must contain enough information to teach a person skilled in the art how “to make and use the invention without undue experimentation.” Finally, to satisfy the best mode requirement, if the inventor knew of a preferred way of practicing her invention at the time of the patent application, the specification must disclose that “preferred embodiment[]” of the invention.

existent knowledge from the public domain, or to restrict free access to materials already available.”

50 Id. Patent law often relies on the concept of a “person having ordinary skill in the art,” a “hypothetical person” with a typical level of skill in the relevant technology who is “presumed to be aware of all the pertinent prior art” in the particular field. See Standard Oil Co. v. Am. Cyanamid Co., 774 F.2d 448, 454 (Fed. Cir. 1985).

Patent Claims

Section 112(b): Definiteness

If granted, the legal scope of the patent is defined by the patent claims, a sequence of statements that formally defines the legal scope of the patentee’s asserted rights. In essence, while the specification explains the invention in a technical sense, the claims set forth the legal effect of the patent. Much as a deed may describe the boundaries of a tract of land, the claims define the “metes and bounds” of the patent right. Patent claims must be sufficiently definite to be valid—that is, they must “particularly point[] out and distinctly claim[] the subject matter which the inventor . . . regards as the invention.” In other words, when the claims are read in context, they must “inform, with reasonable certainty, those skilled in the art about the scope of the invention.”

Section 112(f): Functional Claiming

For the most part, the current Patent Act uses a system of peripheral claiming, in which the patent claims formally set out the outer boundaries of the patentee’s rights. However, the Patent Act still retains elements of its former system of central claiming, in which the patentee would describe the core principles or examples of what he had invented, but need not formally delineate the outer boundaries of his rights. For example, under the doctrine of equivalents, an accused infringer may be found liable even if his product does not literally meet every element of the on which a patent claim can be invalidated in subsequent patent infringement proceedings. 35 U.S.C. § 282(b)(3)(A).

60 See Ariad, 598 F.3d at 1347 (Fed. Cir. 2010); In re Vanco Mach. & Tool, Inc., 752 F.2d 1564, 1577 n.5 (Fed. Cir. 1985).

62 35 U.S.C. § 112(b); Laitram Corp. v. NEC Corp., 163 F.3d 1342, 1347 (Fed. Cir. 1998) (“[I]t is the claims, not the written description, which define the scope of the patent right.”).

Until the late 19th century, however, central claiming prevailed: the patentee need only describe the core principle or an example of his invention, and courts would decide whether the accused infringer’s product or method was sufficiently similar to the patentee’s invention to infringe the patent. See Lemley, supra, at 910-11; Fromer, supra, at 731-33. Peripheral claiming began as a defensive strategy by patentees to describe their invention at a higher level of generality, and the gradual switch toward the modern patent claiming was eventually codified in the Patent Act in 1870. See An Act to revise, consolidate, and amend the Statutes relating to Patents and Copyrights, Pub. L. No. 41-230 § 26, 16 Stat. 198, 201 (1870) (requiring patent applicant to “particularly point out and distinctly claim the part, improvement, or combination which he claims as his invention or discovery”); see generally Fromer, supra, at 731-35 (reviewing American patent law’s historical shift from central to peripheral claiming); Dan L. Burk & Mark A. Lemley, Fence Posts or Sign Posts? Rethinking Patient Claim Construction, 157 U. Pa. L. Rev. 1743, 1766-71 (2009) (same). This account of patent-claiming history is somewhat simplified: notably, despite the 1870 statutory shift, the Patent Act retained (and retains) features of central claiming. See Burk & Lemley, supra, at 1771 (“[I]t may be fairer to say that during the twentieth century we had not a peripheral-claiming system, but a hybrid peripheral claiming system.”).

patent claims, if the differences between a claim element and its alleged equivalent in the accused product are “insubstantial.”

A potential danger of a peripheral claiming system is that patentees may seek to claim more than they invented by couching the patent claims in broad, functional language—that is, by claiming a result or goal without limitation to any specific structure or device that accomplishes the result. In Halliburton Oil Well Cementing Co. v. Walker, the Supreme Court limited this practice, invalidating as indefinite a “functional” patent claim, in which the invention—an apparatus for determining the location of an obstruction in an oil well—was claimed not in terms of specific machinery, but instead as a “means for” performing various functions.

Functional claims (also known as “means-plus-function” claims) such as those in Halliburton may be convenient for the patentee, who can express a claim element in terms of a general end, as opposed to an “exhaustive list” of every possible apparatus that could be used to perform that goal. On the other hand, as Halliburton recognized, functional claims may be overbroad and ambiguous, or permit the patentee to claim more than he actually invented. In the Patent Act of 1952, Congress enacted current Section 112(f) as a compromise for functional claims, overruling Halliburton but providing a standard to make functional claims more definite.

Under Section 112(f), a patentee may opt to express a claim element as “a means or step for performing a specified function without the recital of structure, material, or acts in support thereof.” If the patentee chooses to claim functionally, however, the claim is construed not to cover all possible means of performing the function, but only “the corresponding structure, material, or acts described in the specification and equivalents thereof.” Courts have held that a patentee is presumed to invoke Section 112(f) when the term “means” is used in the claims. Conversely, there is a presumption that the patentee does not invoke Section 112(f) if she does not use the term “means,” but that presumption may be overcome, such that Section 112(f) will apply to any claim that fails to recite a “sufficiently definite structure” for performing a function.

---

67 See Lemley, supra note 64, at 911-13. Such claiming should in theory be prohibited on novelty or enablement grounds, see 35 U.S.C. §§ 102, 112(a), but the problem persists, for example, in modern software patents. See Lemley, supra note 64, at 921-23 (citing examples).
68 See 329 U.S. 1, 8-9, 12-13 (1946).
69 Stephen Winslow, Means for Improving Modern Functional Patent Claiming, 98 Geo. L.J. 1891, 1892 (2010) (“A patent can be clearer, more concise, and more comprehensible when the patentee drafts her claims using language describing what a particular element does, rather than giving an exhaustive list of the various structures that could provide that function within her invention.”).
70 See Halliburton, 329 U.S. at 12.
71 See Williamson v. Citrix Online, LLC, 792 F.3d 1339, 1347 (Fed. Cir. 2015) (en banc) (“In enacting § 112(f), Congress struck a balance in allowing patentees to express a claim limitation by reciting a function to be performed rather than by reciting structure for performing that function, while placing specific constraints on how such a limitation is to be construed . . . .”); P.J. Federico, COMMENTARY ON THE NEW PATENT ACT (West 1954), reprinted in 75 J. PAT. & TRADEMARK OFF. SOC’Y 161, 186 (1993) (observing that “[t]he last paragraph of section 112” means that “decisions such as that in [Halliburton Oil] are modified or rendered obsolete . . . .”).

Rights of Patent Holders

With some exceptions, a patent is generally granted “for a term beginning on the date on which the patent issues and ending 20 years from the date on which the application for the patent was filed.” The Patent Act includes provisions that may modify the 20-year term, including to account for excessive delays in patent examination at the PTO, or delays associated with obtaining marketing approval from other federal agencies.

Once granted, the holder of a valid patent has the exclusive right to make, use, sell, or import the invention in the United States until the patent expires. Any other person who practices the invention (i.e., makes, uses, sells, offers to sell, or imports it) without permission from the patent holder infringes the patent and is potentially liable for monetary damages and injunctive relief if sued by the patentee.

Defending Against Patent Suits

Parties accused of patent infringement may defend on several grounds. First, although patents benefit from a presumption of validity, the accused infringer may assert that the patent is invalid. To prove invalidity, the accused infringer must show, by clear and convincing evidence, that the PTO should never have granted the patent because it failed to meet the requirements for

---

78 Id. § 154(b)(1).
79 Id. § 156. In the pharmaceutical context, patents claiming a drug product or medical device (or a method of using or manufacturing the same) may be extended for up to five years to account for delays in obtaining regulatory approval, if certain statutory conditions are met. See Eli Lilly & Co. v. Medtronic, Inc., 496 U.S. 661, 670-71 (1990); Merck & Co. v. Hi-Tech Pharmacal Co., 482 F.3d 1317, 1320-21 (Fed. Cir. 2007); Stephanie Plamondon Bair, Adjustments, Extensions, Disclaimers, and Continuations: When Do Patent Term Adjustments Make Sense?, 41 CAP. U. L. REV. 445, 460 (2013).
81 Id. §§ 271, 281, 283-85.
87 35 U.S.C. § 282(a), (b)(2)-(3).
patentability.\textsuperscript{88} Thus, for example, the accused infringer may argue that the invention lacks novelty, is obvious, or claims nonpatentable subject matter; that the patent fails to enable the invention; or that the patent claims are indefinite.\textsuperscript{89} Second, the accused infringer may claim an “absence of liability” because of noninfringement.\textsuperscript{90} In other words, even presuming the patent is valid, the patentee may fail to prove that the activities of the accused infringer fall within the scope of the patent claims—that is, the accused infringer is not making, using, selling, or importing the patented invention.\textsuperscript{91} Finally, the accused infringer may argue that the patent is unenforceable based on the inequitable or illegal activities of the patent holder, such as obtaining the patent through fraud on the PTO.\textsuperscript{92}

Following the passage of the 2011 Leahy-Smith America Invents Act (AIA),\textsuperscript{93} the Patent Trial and Appeal Board (PTAB) has become an increasingly important forum for patent disputes.\textsuperscript{94} The AIA created several new administrative procedures for challenging patent validity, including (1) post-grant review (PGR), which allows any person to challenge patent validity based on any of the requirements of patentability if the PGR petition is filed within nine months of the patent’s issuance;\textsuperscript{95} (2) inter partes review (IPR), which allows any person other than the patentee to challenge patent validity on limited grounds (novelty or obviousness based on prior patents or printed publications) at any time after nine months following the patent’s issuance;\textsuperscript{96} and (3) a transitional program for covered business method patents (CBM), a PGR-like process limited to certain patents claiming “business methods” that will be available only through September 2020.\textsuperscript{97} Of these procedures, IPR is by far the most widely used.\textsuperscript{98}

### The Current Law of Section 101

At the most general level, there are two basic requirements for an invention to claim patent-eligible subject matter. First, the invention must fit into one or more of the four statutory categories in Section 101—the claimed invention must be a (1) process, (2) machine, (3) manufacture, or (4) composition of matter.\textsuperscript{99} Given the (intentionally) expansive nature of...
these terms, nearly all claimed inventions will satisfy this requirement. Nonetheless, exceptions to this rule do exist. For example, in In re Nuijten, the Federal Circuit held that a transitory electromagnetic signal was neither a process, manufacture, machine, or composition of matter, and was therefore not patent-eligible subject matter.

Because most claimed inventions fit into one of the four statutory categories, the second requirement tends to be more practically important, and receives most of the attention. The second patentable subject matter requirement is that the invention cannot claim one of the judicially created categories of ineligible subject matter—the claimed invention must not be a (1) law of nature; (2) natural phenomenon; or (3) abstract idea. As explained below, the modern Supreme Court has articulated a two-step test for this second requirement, known as the Alice/Mayo framework.

The Supreme Court has justified the three ineligible categories as necessary to prevent patent monopolies on the “‘basic tools of scientific and technological work,’” which “might tend to impede innovation more than it would tend to promote it.” Thus, the Court has explained that “a new mineral discovered in the earth or a new plant found in the wild is not patentable subject matter. Likewise, Einstein could not patent his celebrated law that E=mc²; nor could Newton have patented the law of gravity.” At the same time, the Court has said that even if a mathematical formula or law of nature is not patentable “in the abstract,” a practical application of such a principle or law “to a new and useful end” is patent-eligible.

---

100 See Lemley et al., supra note 21, at 1328 (“[P]atent claims almost never fall outside of the four fundamental categories of § 101 . . . .”).

101 500 F.3d 1346, 1354-57 (Fed. Cir. 2007).

102 See Kevin Emerson Collins, Patent-Ineligibility As Counteraction, 94 WASH. U. L. REV. 955, 968 (2017) (“Contemporary debates over patent-ineligibility rarely parse the plain meanings of [the four statutory categories]. They focus instead on a set of judicial exclusions from patent-eligibility that are not expressly codified in the statute: laws of nature, products of nature, and abstract ideas . . . .”).

103 Diamond v. Diehr, 450 U.S. 175, 185 (1981). Diehr’s modern distillation of patentable subject matter doctrine to these three categories is a somewhat simplified version of the doctrine’s historical development, which often identified patent-ineligible categories in addition to these three. See, e.g., Daniel J. Klein, The Integrity of Section 101: A ‘New and Useful’ Test for Patentable Subject Matter, 93 J. PAT. & TRADEMARK OFF. SOC’y 287, 288 (2011); (listing eight terms that the Court has used to denote patent-ineligible subject matter); Michel, supra note 20, at 1757 (counting six categories of patent-ineligible subject matter); accord Emily Michiko Morris, Intuitive Patenting, 66 S.C.L. REV. 61, 66 n.31 (2014) (describing the Supreme Court’s patentable subject matter jurisprudence as “insolubly murky”).

104 See infra “The Modern Alice/Mayo Framework.”

Beyond such broad illustrations, it is not easy to precisely define what an “abstract idea,” “law of nature,” or “natural phenomenon” is.\textsuperscript{108} Because these exceptions to patent-eligible subject matter are judicially created, they have no formal statutory definition; their meaning has instead been developed through two centuries of “common law” case-by-case adjudication in the federal courts.\textsuperscript{109} As such, the scope of patentable subject matter has waxed and waned over time, depending on the trends of recent judicial decisions.\textsuperscript{110}

This section overviews the leading Supreme Court cases addressing patent-eligible subject matter, beginning with formative cases from the 19th century and culminating in the series of recent Supreme Court decisions that have led some to call for legislative reform of Section 101. Table 1 summarizes the facts and holdings of the major cases.

**Historical Development of the Judicial Exceptions to Patent-Eligible Subject Matter**

**Nineteenth Century**

The 1853 case of *Le Roy v. Tatham*, the “fountainhead” of American patentable subject matter jurisprudence,\textsuperscript{111} concerned a patent on machinery to manufacture metal pipes that exploited a newly developed property of lead.\textsuperscript{112} Although the Court ultimately did not decide the case on subject matter grounds,\textsuperscript{113} *Le Roy* relied on influential English patent cases\textsuperscript{114} to set forth a basic

\textsuperscript{108} See Morris, supra note 103, at 62 (describing the Supreme Court’s patentable subject matter jurisprudence as “insolubly murky”); Klein, supra note 103, at 289 (describing the three categories of nonpatentable subject matter as “metaphysically vague and extra-statutory”); Funk Bros., 333 U.S. at 134-35 (Frankfurter, J., concurring) (“It only confuses the issue, however, to introduce such terms as ‘the work of nature’ and the ‘laws of nature.’ For these are vague and malleable terms infected with too much ambiguity and equivocation. Everything that happens may be deemed ‘the work of nature,’ and any patentable composite exemplifies in its properties ‘the laws of nature.’”).

\textsuperscript{109} See, e.g., Peter S. Menell, *Forty Years of Wondering in the Wilderness and No Closer to the Promised Land: Bilski’s Superficial Textualism and the Missed Opportunity to Return Patent Law to Its Technology Mooring*, 63 STAN. L. REV. 1289, 1307 (2011) (“Since the founding of our nation, courts have evolved [patentable subject matter limits] within a hybrid constitutional/common law tradition.”); Lemley et al., supra note 21, at 1325 (describing the three judicially created ineligible categories as “common law exceptions” to patentable subject matter).

\textsuperscript{111} See, e.g., Lefstin, supra note 110, at 594 (describing Le Roy as “the fountainhead of subject-matter exclusion in American patent law”); Menell, supra note 109, at 1296 (describing Le Roy as “the foundation for much patentable subject matter jurisprudence”).

\textsuperscript{112} 55 U.S. (14 How.) 156, 176-77 (1853).

\textsuperscript{113} The dispositive issue in the case was the scope of the patent claims. See infra note 177; Lefstin, supra note 110, at 595 (“The outcome in Le Roy therefore turned entirely on the Court’s narrow construction of the claim.”).

\textsuperscript{114} For a full historical account of these English cases and how they shaped Supreme Court’s jurisprudence, see Lefstin,
distinction between abstract “principles” and natural laws (which may not be patented) and practical applications of those principles (which may be patented). The Court stated that “[a] principle, in the abstract, is a fundamental truth; an original cause; a motive; these cannot be patented, as no one can claim in either of them an exclusive right.” On the other hand, a “new property discovered in matter, when practically applied, in the construction of a useful article of commerce or manufacture, is patentable,” for the “invention is not in discovering [the natural principles], but in applying them to useful objects.”

In its next term, the Court applied this rule in the famous case of O’Reily v. Morse, concerning Samuel Morse’s patent on the telegraph. Although the Court found that Morse was the first inventor of the telegraph and sustained much of his patent, the Court rejected Morse’s eighth claim to any “use of the motive power of the electric or galvanic current . . . however developed for marking or printing intelligible characters, signs, or letters, at any distances, being a new application of that power of which I claim to be the first inventor or discoverer.” Observing that “the discovery of a principle in natural philosophy or physical science, is not patentable,” Chief Justice Taney’s majority opinion held that Morse’s eighth claim was “too broad” because he had not discovered “that the electric or galvanic current will always print at a distance, no matter what may be the form of the machinery” used, but only that the specific “complicated and delicate machinery” disclosed in the patent specification would do so.

In the second half of the nineteenth century, the Court issued a series of important decisions on the patentability of processes. The end result of these cases was a move away from an earlier rule that prohibited “pure” method patents as ineligible (i.e., a process claimed independently of the specific machinery used to accomplish the method) either by construing nominal process patents as claiming a machine or limiting the process patents to the machinery disclosed and its equivalents. In Cochrane v. Deener, which involved a patent on an improved manufacturing process for flour, the Court defined a patentable process as “a mode of treatment of certain materials to produce a given result. It is an act, or a series of acts, performed upon the subject-matter to be transformed and reduced to a different state or thing.” Cochrane held that such methods are patentable “irrespective of the particular form of the instrumentalities used.”

123 See, e.g., Corning v. Burden, 56 U.S. (15 How.) 252, 268-70 (1853) (construing “equivocal” patent to claim a machine, and not a process, to save its validity because a “process” in the sense of “the function of a machine, or the effect produced by it” cannot be patented; see generally Sarnoff, supra note 110, at 67 (“[A]t the end of the eighteenth century, pure method patents—methods claiming all future applications and not merely those substantially similar to the disclosed implementing machinery and their equivalents—were ineligible for protection and remained so until the late nineteenth century.”) & id. n. 88 (collecting cases).
124 94 U.S. 780, 788 (1876).
125 Id. at 787.
Similarly, in *Tilghman v. Proctor*, the Court held that a method for separating fat into glycerin and fatty acids using water, pressure, and heat was patentable.\(^{126}\)

In *The Telephone Cases*, the Court distinguished *Morse* to allow Alexander Graham Bell’s patent claim on a “method of and apparatus for transmitting vocal or other sounds telegraphically, as herein described, by causing electrical undulations, similar in form to the vibrations of the air accompanying the said vocal or other sounds, substantially as set forth.”\(^{127}\) Chief Justice White interpreted *Morse* as holding that “the use of magnetism as a motive power, without regard to the particular process with which it was connected in the patent, could not be claimed, but that its use in that connection could.”\(^{128}\) The Court found that Bell’s claim, in contrast to Morse’s, did not reach uses of electricity to transmit speech that are “distinct from the particular process with which it is connected in [Bell’s] patent,” and upheld the claim, so construed.\(^{129}\)

### Twentieth Century

In the first half of the 20th century, the Court decided two major cases on the patentability of natural phenomena. In *American Fruit Growers v. Brogdex Co.*, the Court rejected patent claims on citrus fruit treated with a solution of borax to render it resistant to mold.\(^{130}\) The Court held that treated fruit was not a “manufacture” under Section 101, but a patent-ineligible “natural article”; treatment with borax did not “change in the name, appearance, or general character of the fruit” or imbue it with a “new or distinctive form, quality, or property.”\(^{131}\) In *Funk Brothers Seed Co. v. Kalo Inoculant Co.*, the Court rejected patent claims on an inoculant for leguminous plants consisting of multiple species of bacteria, where the particular bacterial strains were selected so as not to inhibit each other (as prior multispecies combinations had).\(^{132}\) Because the patentee’s combination “produces no new bacteria [and] no change in the six species of bacteria,” Justice Douglas’s majority opinion held that it was only “the discovery of some of the handiwork of nature and hence is not patentable.”\(^{133}\)

From 1972 to 1981, the Supreme Court decided four patentable subject matter cases.\(^{134}\) In *Gottschalk v. Benson*, the Court held that an algorithm for converting binary-coded decimal numerals into pure binary numerals (either by hand, or, more practically, on a computer) was patent-ineligible.\(^{135}\) Justice Douglas reasoned that “one may not patent an idea” and that upholding this patent would “wholly pre-empt the mathematical formula and in practical effect would be a patent on the algorithm itself.”\(^{136}\) Second, in *Parker v. Flook*, the Court rejected a patent on a method for updating alarm limits during catalytic conversion of hydrocarbons (such as

---

\(^{126}\) 102 U.S. 707, 728-30 (1880).

\(^{131}\) Id. at 11-12.

\(^{132}\) 333 U.S. 127, 130-32 (1948).

\(^{133}\) Id.

\(^{134}\) Three of these four (*Benson, Flook, and Diehr*), which concern the patentability of inventions relating to mathematical formulas and computers, are often referred to as a “trilogy.” See, e.g., Michel, *supra* note 20, at 1755; Menell, *supra* note 109, at 1290. This usage leaves out *Chakrabarty*, which was also decided in the same time frame, because that case concerned the products of nature exception.

\(^{135}\) 409 U.S. 63, 64, 71-73 (1972).

\(^{136}\) Id. at 71-72.
petroleum), which relied in part on a mathematical formula, because the only novel feature of the method was the mathematical formula.137 Third, in *Diamond v. Chakrabarty*, the Court upheld a patent on a genetically engineered bacterium useful in breaking down oil (e.g., in cleaning up oil spills).138 Chief Justice Burger distinguished *American Fruit Growers and Funk Brothers* because this bacterium, although a living organism, was human-made and possessed “markedly different characteristics from any [bacteria] found in nature.”139 Finally, in *Diamond v. Diehr*, the Court distinguished *Flook* to uphold a patent on a process for molding synthetic rubber that relied on a mathematical formula (the Arrhenius equation).140 Justice Rehnquist’s majority opinion reached back to *Cochrane v. Deener*, holding that the process at issue was patentable because it transformed an article (uncured rubber) into a different state or thing.141 Even though the method used a mathematical formula, the patent in *Diehr* did not claim the formula itself and would not “pre-empt the use of that equation” in other fields.142

After *Diehr*, the Court did not decide a major patentable subject matter case for nearly 30 years.143 Development of the patent-eligible subject matter law was primarily left to the Federal Circuit, whose decisions generally expanded patent-eligible subject matter,144 such that by the late 1990s Section 101 became perceived as “a dead letter.”145

---

139 Id. at 310.
140 450 U.S. 175, 177, 183-93 (1981).
141 Id. at 184.
142 Id. at 187. In the view of many commentators, *Diehr* effectively overturned *Flook* (or at least some statements in *Flook*) without explicitly saying so. See, e.g., Michel, supra note 20, at 1756 (“*Diehr*, to my eye, overruled *Flook* five to four.”); Menell, supra note 109, at 1298 (“Justice Rehnquist [in *Diehr*] effectively overrode *Flook*’s statutory subject matter test.”); BCLT Report, supra note 16, at 554 (“*Flook* was effectively overruled three years later in *Diamond v. Diehr* . . . ”); Athena Diagnostics, Inc. v. Mayo Collaborative Servs., 927 F.3d 1333, 1346 (Fed. Cir. 2019) (Chen, J., concurring in the denial of rehearing en banc) (“*Given Diehr*’s evident disagreement with *Flook*’s analysis, *Diehr*, as the later opinion, was widely understood to be the guiding, settled precedent on § 101 for three decades.”); Dennis Crouch, *Revival of Parker v. Flook II*, PATENTLYO (Jan. 4, 2018), https://patentlyo.com/patent/2018/01/revival-parker-flook.html (presenting data showing that courts rarely cited *Flook* between 1982 and 2007).

The Supreme Court does not appear to view matters this way, however—it continues to cite and rely on *Flook* as good law. See, e.g., Alice Corp. Pty. v. CLS Bank Int’l, 573 U.S. 208, 218, 222 (2014).

143 See Lemley et al., supra note 21, at 1317; Menell, supra note 109, at 1298. There are two partial exceptions to this generalization. The first is *J.E.M. Ag Supply, Inc. v. Pioneer Hi-Bred Int’l, Inc.*, in which the Court held that human-made plant varieties were patentable under Section 101. 534 U.S. 124, 127 (2001). However, that case turned not on general patent-eligibility principles, but on whether two specialized statutes for protection of plant varieties precluded utility patents on plants under the general provisions of Section 101. Id. at 132-44. Second, although the Supreme Court ultimately did not decide the case, Justice Breyer’s 2006 dissent from the dismissal of a writ of certiorari as improvidently granted in *Laboratory Corporation of America Holdings v. Metabolite Laboratories, Inc.*, served as an important signal of the Court’s renewed interest in patentable subject matter. See 548 U.S. 124 (2006). *Metabolite* involved claims for diagnosing vitamin deficiencies, much like the claims the Supreme Court would address years later in *Mayo*, when the Court largely adopted the reasoning of Justice Breyer’s *Metabolite* dissent. See id. at 129, 135-38.

145 Lemley et al., supra note 21, at 1318 (“[A]fter 1998, patentable subject matter was effectively a dead letter”).
The Modern Alice/Mayo Framework

In 2010, the Supreme Court reentered the field of patent-eligible subject matter, deciding four cases on the issue within five years. These cases established the two-step Alice/Mayo test for patentable subject matter.

The first step of the Alice/Mayo test addresses whether the patent claims are “directed to” an ineligible concept: a law of nature, a natural phenomenon, or an abstract idea. The inquiry at step one focuses on the “claim as whole.” To be “directed to” an eligible concept at step one of Alice/Mayo, the claims must not simply involve a patent-ineligible concept. Rather, the “focus on the claims” must be a patent-ineligible concept, as opposed to the improvement of a technological process. If the patent claims are not directed to an ineligible concept, then the subject matter is patent-eligible.

If the claims are directed to an ineligible category, then the invention is not patentable unless the patent claims have an “inventive concept” under the second step of the Alice/Mayo test. Step two of Alice/Mayo considers the elements of each patent claim both individually and as an ordered combination in the search for an “inventive concept”—additional elements that “transform the nature of the claim” into a patent-eligible application of an ineligible concept. To have an “inventive concept,” the patent claims must contain elements “sufficient to ensure that the patent in practice amounts to significantly more than a patent upon the [ineligible concept] itself.” Claim limitations that are “conventional, routine and well understood,” such as generic computer implementation, cannot supply an inventive concept.

Bilski v. Kappos, the Supreme Court’s first modern foray into patentable subject matter doctrine, concerned a patent on a business method for hedging against price-fluctuation risks in energy and commodity markets. The Federal Circuit had held that this method was not patentable as a “process” under Section 101 because it failed the “machine-or-transformation test”—that is, it was neither “tied to a particular machine or apparatus” nor “transform[ed] a particular article into a different state or thing.” All nine members of the Supreme Court agreed with that result—that

Cir. 2015); accord Alice, 573 U.S. at 225; Mayo, 566 U.S. at 79 (“Purely ‘conventional or obvious’ [pre-solution activity] is normally not sufficient to transform an unpatentable law of nature into a patent-eligible application of such a law.”) (quoting Parker v. Flook, 437 U.S. 584, 590 (1978)).
155 Bilski, 561 U.S. at 598-99.
156 In re Bilski, 545 F.3d 943, 954 (Fed. Cir. 2008) (en banc) (Michel, C.J.).
the business method at issue was not patent-eligible—but differed significantly as to their reasoning. Writing for five Justices, Justice Kennedy held that the machine-or-transformation test was not the “sole test” for determining whether a process is patent-eligible but nonetheless “a useful and important clue.”158 While the majority rejected the “atextual” notion that business methods were categorically unpatentable under Section 101,159 it relied on Benson and Flook to conclude that this particular patent attempted to claim an unpatentable abstract idea: the “concept of hedging risk.”160 Concurring only in the judgment, Justice Stevens wrote for four Justices who would have held, based on the history of the Patent Act and its constitutional purpose, that business methods were categorically patent-ineligible.161

In Mayo Collaborative Services v. Prometheus Laboratories, the Court addressed the scope of the “law of nature” exception.162 The patent in Mayo claimed a method for measuring metabolites in human blood in order to calibrate the dosage of thiopurine drugs in the treatment of autoimmune disorders.163 Writing for a unanimous Court, Justice Breyer’s opinion held that the patent claims were addressed to a law of nature: “namely, relationships between concentrations of certain metabolites in the blood and the likelihood that a dosage of a thiopurine drug will prove ineffective or cause harm.”164 Because the claims were little “more than an instruction to doctors to apply the applicable laws when treating their patients,” the patent lacked any inventive concept and was held to be patent-ineligible.165

The next case, Association for Molecular Pathology v. Myriad Genetics, Inc., concerned the applicability of the “natural phenomena” exception to the patentability of human DNA.166 The inventor in Myriad had discovered the precise location and genetic sequence of two human genes associated with an increased risk of breast cancer.167 Based on this discovery, the patentee claimed two molecules associated with the genes: (1) an isolated DNA segment and (2) a complementary DNA (cDNA) segment, in which the nucleotide sequences that do not code for amino acids were removed in the laboratory.168 Justice Thomas’s unanimous opinion in Myriad held that isolated DNA segments were nonpatentable products of nature because the patent claimed naturally occurring genetic information.169 The Court concluded, however, that cDNA, as a synthetic molecule distinct from naturally occurring DNA, was patentable even though the underlying nucleotide sequence was dictated by nature.170

170 Id. at 594-95.
Most recently, *Alice Corp. v. CLS Bank International* examined the scope of the “abstract idea” category of nonpatentable subject matter.\(^{171}\) *Alice* concerned a patent on a system for mitigating “settlement risk”—the risk that only one party to a financial transaction will pay what it owes—using a computer as an intermediary.\(^{172}\) The Court first held, relying on *Bilski*, that the invention was directed at “the abstract idea of intermediated settlement.”\(^{173}\) Although this idea was implemented on a computer (which is, of course, a physical machine), the patent lacked an inventive concept because the claims merely “implement[ed] the abstract idea of intermediated settlement on a generic computer.”\(^{174}\)

Table 1 summarizes the facts and holding of the Supreme Court’s major patentable subject matter cases, in reverse chronological order.

175 Although Mackay Radio is widely quoted in subsequent jurisprudence for the proposition that useful applications of laws of nature are patentable, see, e.g., Mayo Collaborative Servs. v. Prometheus Labs., Inc., 566 U.S. 66, 71 (2012); Diamond v. Diehr, 450 U.S. 175, 188 (1981). Justice Stone’s statement is dicta because the Court merely “assume[d], without deciding” that the invention was patentable, ruling instead on grounds of noninfringement. See Mackay Radio, 306 U.S. at 94, 101.
The specific doctrinal basis of *O'Reilly v. Morse* is unclear, as the Court speaks in language that, when cast in modern terms, sounds at times like enablement and at times like patentable subject matter. Compare 56 U.S. at 113 (“The court is of opinion that the claim is too broad . . . .”) with id. at 116 (“[T]he discovery of a principle in natural philosophy or physical science, is not patentable.”). Many patent scholars regard *Morse* as a case not about Section 101 but about enablement under Section 112 of the modern Patent Act. See, e.g., Taylor, supra note 20, at 205 (“In modern terms, it is quite clear that the problem with Claim 8 in Morse’s patent was based on the enablement and written description requirements located in § 112 and not in § 101.”) Lefstin, supra note 110, at 597 (“Morse is about disclosure and scope, not patent-eligible subject matter.”). The Supreme Court, however, appears to regard *Morse* as a primarily a subject matter decision. See, e.g., *Mayo*, 566 U.S. at 70, 73 (citing to *Morse* to support notion that “laws of nature” or claims that “preempt the use of a natural law” are “not patentable”).

**Criticisms of the Alice/Mayo Framework**

Generally, critics of the Court’s recent patentable subject matter jurisprudence raise four principal concerns. First, the *Alice/Mayo* framework is criticized as excessively vague, subjective, and/or unpredictable in application. For example, the Federal Circuit has indicated that when determining whether a patent claim is “directed to” an ineligible concept at step one, the court must determine whether the “focus” of the claims is on that concept. At the same time, the Federal Circuit has cautioned that this “focus” must be articulated “with enough specificity to...
ensure the step one inquiry is meaningful." But the appropriate level of specificity can vary from patent to patent and from judge to judge.

Thus, in the view of many stakeholders, the Supreme Court’s patentable subject matter case law and the Federal Circuit’s implementation of the Alice/Mayo framework fail to articulate “objective, predictable criteria” for making patent-eligibility determinations. Key terms, such as what an “abstract idea” is, or precisely how claim elements can make an invention “significantly more” than an ineligible category (the “inventive concept”), are largely left undefined, making it difficult for patent applicants and litigants to know whether their patent claims will survive judicial scrutiny. Moreover, the Federal Circuit has explicitly recognized that the two steps of the analysis are not clearly defined and may overlap. As a result, many observers characterize the court’s Section 101 jurisprudence as a “highly subjective,” “I know it when I see it” approach. This subjectivity, in the view of critics, injects unpredictability and uncertainty into whether an invention is of a type that is patentable.

Second, the Alice/Mayo framework is criticized as legally flawed on various grounds. Some stakeholders argue that the Alice/Mayo framework misinterprets Section 101, imposing “extra-statutory” requirements for patent eligibility, contrary to congressional intent or the constitutional purpose of patent law. Others argue that Mayo’s requirement of an “inventive concept” rests on

182 See Visual Memory LLC v. NVIDIA Corp., 867 F.3d 1253, 1262 (Fed. Cir. 2017) (Hughes, J., dissenting) (disagreeing with the majority over whether characterizing the claims as directed to “categorical data storage” views the invention “at an unduly ‘high level of abstraction’”) (quoting Enfish, LLC v. Microsoft Corp., 822 F.3d 1327, 1337 (Fed. Cir. 2016)).

183 See id. at 30 (describing comments that the Alice/Mayo test “fails to define crucial terms, such as ‘abstract’ and ‘substantially more’”); Taylor, supra note 20, at 231 (“[N]o one really knows what an inventive concept is.”); Lemley et al., supra note 21, at 1316 (“[N]o one understands what makes an idea ‘abstract,’ and hence ineligible . . . .”); Morris, supra note 103, at 68 (arguing that the judicially created patentable subject matter decisions are “merely post hoc rationalizations”). Some Supreme Court Justices have echoed this criticism. See, e.g., Bilski v. Kappos, 561 U.S. 593, 621 (2010) (Stevens, J., concurring in the judgment) (“The Court . . . never provides a satisfying account of what constitutes an unpatentable abstract idea.”); Fred Funk Seed Bros. Co. v. Kalo Inoculant Co., 333 U.S. 127, 134-35 (1948) (Frankfurter, J., concurring) (“It only confuses the issue, however, to introduce such terms as ‘the work of nature’ and the ‘laws of nature.’ For these are vague and malleable terms infected with too much ambiguity and equivocation.”).

184 See id. at 30 (describing comments that the Alice/Mayo test “fails to define crucial terms, such as ‘abstract’ and ‘substantially more’”); Taylor, supra note 20, at 231 (“[N]o one really knows what an inventive concept is.”); Lemley et al., supra note 21, at 1316 (“[N]o one understands what makes an idea ‘abstract,’ and hence ineligible . . . .”); Morris, supra note 103, at 68 (arguing that the judicially created patentable subject matter decisions are “merely post hoc rationalizations”). Some Supreme Court Justices have echoed this criticism. See, e.g., Bilski v. Kappos, 561 U.S. 593, 621 (2010) (Stevens, J., concurring in the judgment) (“The Court . . . never provides a satisfying account of what constitutes an unpatentable abstract idea.”); Fred Funk Seed Bros. Co. v. Kalo Inoculant Co., 333 U.S. 127, 134-35 (1948) (Frankfurter, J., concurring) (“It only confuses the issue, however, to introduce such terms as ‘the work of nature’ and the ‘laws of nature.’ For these are vague and malleable terms infected with too much ambiguity and equivocation.”).

185 Elec. Power Grp., 830 F.3d at 1353 (“[T]he two stages are plainly related: not only do many of our opinions make clear that the two stages involve overlapping scrutiny of the content of the claims, but we have noted that there can be close questions about when the inquiry should proceed from the first stage to the second.”) (citations omitted).

186 See, e.g., PTO PSM REPORT, supra note 16, at 30 (quoting stakeholder view that Alice/Mayo is “hopelessly subjective”); Taylor, supra note 20, at 227-30 (arguing that Alice/Mayo framework has “no objective guidance” and “leaves the determination of eligibility to the unconstrained, subjective opinion of a patent examiner or judge”); Klein, supra note 103, at 288 (criticizing patentable subject matter case law as amounting to “an ‘I know it when I see it’ approach”).

187 See, e.g., BCLT Report, supra note 16, at 561 (describing “uncertainty and confusion resulting from the Court’s recent [patentable subject matter] jurisprudence”); accord PTO PSM REPORT, supra note 16, at 30-31 (describing views that the Alice/Mayo test yields “unpredictable” and “inconsistent” results).

188 See PTO PSM REPORT, supra note 16, at 28; Klein, supra note 103, at 289-91 (criticizing the three judicially created
a historically inaccurate understanding of 19th century English patent law, first imported into American jurisprudence in cases such as *Le Roy* and *Morse*.\(^{189}\) Finally, many commentators and stakeholders argue that the *Alice/Mayo* framework confuses patent law by conflating eligibility under Section 101 with policy concerns—such as the obviousness of the invention and claim breadth—that are better addressed by other provisions in the Patent Act, such as Sections 102, 103, and 112.\(^{190}\) For example, patent claims have been found to lack an inventive concept at *Alice/Mayo* step two where they implement an abstract idea on conventional computer hardware.\(^{191}\) Issues about what was “conventional” or “well-understood” at the time of the invention, however, are questions usually reserved for novelty or nonobviousness analysis.\(^{192}\)

Third, the *Alice/Mayo* framework is alleged to have detrimental effects on incentives to innovate, especially in the biotechnology and computer software industries. Given the patent claims at issue in *Alice* (a computer-implemented business method), *Myriad* (an isolated human DNA segment), and *Mayo* (a drug dose optimization method), most observers agree that these two industries have been the most affected by the Supreme Court’s recent Section 101 rulings.\(^{193}\) In the biotechnology industry, stakeholders argue that the *Alice/Mayo* framework has limited their ability to obtain patents on diagnostic methods and kits, personalized medicine, and isolated natural substances.\(^{194}\) Views in the computer industry are “sharply divided,” but at least some stakeholders argue that *Alice* has devalued their patents and/or created uncertainty for their business.\(^{195}\) In both fields, some stakeholders argue that the law of Section 101 is reducing incentives to innovate in these areas and driving investment elsewhere.\(^{196}\)

Finally, the uncertainty and unpredictability caused by *Alice/Mayo* is alleged to put the United States at a disadvantage relative to international competitors. Some stakeholders argue that U.S. competitiveness may be harmed because a lack of patent availability will drive investment in certain industries to other countries where such inventions are more clearly patent-eligible.\(^{197}\)

---

\(^{189}\) Lefstin, *supra* note 110, at 565 (arguing that *Alice/Mayo* test’s “inventive application” requirement rests on a “basic misapprehension” of the 19th century English case cited by the Supreme Court); PTO PSM REPORT, *supra* note 16, at 27-28 (same).

\(^{190}\) See PTO PSM REPORT, *supra* note 16, at 31-32; Taylor, *supra* note 20, at 157 (“[T]he current approach to determining patent eligibility confuses the relevant policy concerns underlying numerous discrete patent law doctrines.”); see also Risch, *supra* note 21, at 594 (arguing that the Court’s patentable subject matter doctrine would be more consistent and rigorous if replaced with a strict application of other patentability doctrines such as obviousness, novelty, utility, inventorship, written description, and enablement). This criticism has been echoed by Supreme Court Justices. See Parker v. Flook, 437 U.S. 584, 600 (1978) (Stewart, J., dissenting) (“[T]he majority strikes what seems to me an equally damaging blow at basic principles of patent law by importing into its inquiry under 35 U.S.C. § 101 the criteria of novelty and inventiveness.”).

\(^{191}\) See, e.g., Elec. Power Grp., 830 F.3d at 1355.

\(^{192}\) See, e.g., Berkheimer v. HP Inc., 881 F.3d 1360, 1368-69 (Fed. Cir. 2018) (noting that *Alice/Mayo* step two determination of whether claims are “well-understood, routine and conventional” overlaps with Section 102 novelty inquiry).

\(^{193}\) PTO PSM REPORT, *supra* note 16, at 34-35 (“Among members of the public, there was a general consensus that two industries have been most directly affected by the *Alice/Mayo* framework: life sciences and computer-related technologies.”); see also BCLT Report, *supra* note 16, at 582-85 (examining the *Alice/Mayo* framework’s effects on diagnostics, personalized medicine, biosciences, software, and information technology).

\(^{197}\) See, e.g., Stoll, *supra* note 23 (“The courts’ focus on subject matter eligibility as a mechanism to deny patents for
Others argue that one effect of *Alice*/*Mayo* is a loss of any patent protection for certain inventions, which will enable competitors to “free ride” off of American innovation.198

**Defenses of the *Alice*/*Mayo* Framework**

Defenders of the current law of Section 101 respond that these criticisms of *Alice*/*Mayo* are overstated, and/or that the Supreme Court’s reinvigoration of Section 101 has important benefits for the patent system. As to the subjective or unpredictable nature of Section 101 doctrine, there is some indication that the *Alice*/*Mayo* framework is not quite as unpredictable as is sometimes claimed.199 Some commentators also observe uncertainty in patentable subject matter law is hardly a new phenomenon,200 and may even be “inevitable.”201 A subjective or “amorphous” approach to patentable subject matter, on this view, may have certain benefits, including flexibility and adaptability to new technologies.202 Moreover, even if one views the current state of the law as unacceptably vague, courts may eventually clarify or change Section 101 doctrine in line with the long history of common law development in this area.203

As to legal correctness of *Alice*/*Mayo*, defenders of the framework note that while the judicially created categories are not directly grounded in the text of Section 101, they have been treated as part of the law “as a matter of statutory *stare decisis* going back 150 years.”204 As to *Mayo*’s reliance on 19th century English patent law, some commentators defend the Supreme Court’s “inventive application” requirement as a faithful reading of this precedent.205 Finally, although the

---

198 See, e.g., Davis, supra note 23 (quoting former PTO Director David Kappos as stating that international competitors “no longer have to steal U.S. technology in [biotech and software], since they can now take it for free”).

200 Morris, supra note 103, at 107 (arguing that the Court’s “intuitive” approach to patentable subject matter determinations is “inevitable”).

201 Id. at 107-09 (arguing that intuitive approach to Section 101 may be “desirable” because “there is simply no other more rigorous and yet durable way of identifying the proper boundaries for patentable subject matter” and “vagueness provides the flexibility necessary to adjust future technological developments”); Duffy, supra note 110, at 639 (“[T]he traditional doctrines of patentable subject matter—the prohibition against patenting abstract ideas, natural phenomena, and principles of nature—have survived because . . . they have been amorphous.”).

202 See PTO PSM REPORT, supra note 16, at 23-24 (expressing stakeholder views that recent judicial decisions are part of the normal common law development of Section 101, and that the Federal Circuit’s subsequent development of the law may be “headed in the right direction”).

**Potential Rationales for Section 101**

More broadly, there is a long-running and thoughtful debate over the functions and purposes that Section 101 serves in the patent system. For its part, the modern Supreme Court has largely settled on the “preemption rationale” for the judicially created subject matter exclusions. Recent decisions assert that abstract ideas, laws of nature, and natural phenomena should not be patentable because permitting a monopoly on the “‘basic tools of scientific and technological work’ . . . might tend to impede innovation more than it would tend to promote it,” in that such

---

1150_petitioneramcu9lawprofs.pdf.

206 *See, e.g.*, Morris, *supra* note 103, at 113 (“To be sure, patentable subject matter overlaps with and serves some of the same purposes as the other patentability requirements . . . But only patentable subject matter serves to distinguish patentable technology from unpatentable discoveries, information, and human thought and activity.”); Lemley et al., *supra* note 21, at 1330-32 (distinguishing purpose of Section 101 from Section 112); *accord Mayo*, 566 U.S. at 90-91; Athena Diag., Inc. v. Mayo Collaborative Servs., 927 F.3d 1333, 1337-39 (Fed. Cir. 2019) (Dyk, J., concurring in the denial of rehearing en banc).

207 *See generally infra* “Potential Rationales for Section 101.”

208 A patent assertion entity, sometimes called a nonpracticing entity or (pejoratively) a “patent troll,” is a loose term for an individual or organization that seeks to license or litigate patents, but does not itself practice the patented invention. *See Colleen V. Chien, From Arms Race to Marketplace: The Complex Patent Ecosystem and Its Implications for the Patent System*, 62 HASTINGS L.J. 297, 326-27 (2010) (discussing distinction among various types of nonpracticing patent entities).

210 Sarnoff, *supra* note 110, at 106-24 (reviewing asserted utilitarian and moral benefits of robust Section 101 exclusions); *see generally infra* “Potential Rationales for Section 101.”

211  *PTO PSM REPORT, supra* note 16, at 27.

212  *Id.*

patents would “significantly impede future innovation.” The gist of the preemption rationale is that Section 101 functions to prevent patents that reach so broadly that they “threaten downstream innovation” by preempting all uses of a natural law, abstract idea, or fundamental research tools.

The preemption rationale is not the only potential justification for Section 101, however. Although a complete survey of the various rationales proffered for Section 101 is beyond the scope of this report, at least four broad categories of rationales for Section 101 have been proposed.

First, some commentators argue that Section 101’s purpose is to identify certain patents or categories of patents that should not be granted because their economic harms exceed their benefits—that is, their net social costs are negative with respect to innovation, or more generally. Preemption theory, which claims that certain overbroad patents should be denied patent protection under Section 101 because of their negative effects on downstream innovation, is an example from this group.

Second—in what is in some sense a special case of the first rationale—other commentators assert that Section 101’s purpose is to identify and deny patents to categories of inventions that would have been developed even without a patent incentive. For example, several commentators have argued the patents on business methods should be excluded under Section 101 either because they affirmatively harm innovation and the economy, or because they are simply unnecessary because sufficient incentives to create business methods would exist even if patents are unavailable.

Third, some commentators assert that Section 101 (or elements of Section 101 doctrine) are based not on economic considerations but on moral or ethical concerns. For example, the judicial

---

214 Mayo, 566 U.S. at 91.
215 See, e.g., Lemley et al., supra note 21, at 1346-47; accord Benson, 409 U.S. at 72 (rejecting patent because it would “wholly pre-empt the mathematical formula and in practical effect would be a patent on the algorithm itself”); but see Katherine J. Strandburg, Much Ado About Preemption, 50 Hous. L. Rev. 563, 566 (2012) (critiquing preemption rationale’s “sole focus on broad downstream impact” as not providing a satisfactory explanation for the Supreme Court’s Section 101 case law).
217 See generally Anderson, supra note 216, at 284-85 (overviewing this group of theories); see, e.g., David S. Olson, Taking the Utilitarian Basis for Patent Law Seriously: The Case for Restricting Patentable Subject Matter, 82 Temp. L. Rev. 181, 184 (2009) (arguing that patentable subject matter doctrine should be driven by looking at when “granting a patent right for this type of innovation causes more loss to society than gain”).
218 See supra note 215 and accompanying text.
219 See generally Anderson, supra note 216, at 285-86 (overviewing this group of theories); see, e.g., Pamela Samuelson, Benson Revisited: The Case Against Patent Protection for Algorithms and Other Computer Program-Related Inventions, 39 Emory L.J. 1025, 1136 (1990) (arguing that software should not be patentable in part because “the fact that this growth [in the software industry] has occurred without the aid of patent protection is powerful evidence that patent protection is not necessary for the software industry to thrive”).
221 See Anderson, supra note 216, at 286 (overviewing this group of theories); see, e.g., Sarnoff, supra note 110, at 84-
prohibition on patenting products of nature—such as human DNA sequences—may be motivated by noneconomic, deontological notions of human dignity, or the inviolability of natural creation.\textsuperscript{222}  

Finally, some commentators believe that Section 101 serves no independent purpose in patent law not already better served by other patentability requirements.\textsuperscript{223} On this view, Section 101’s judicially created exceptions to patentable subject matter should simply be eliminated as an independent requirement for patentability, in favor of a rigorous application of the other patentability requirements in Sections 102, 103, and 112 of the Patent Act.\textsuperscript{224}

**Potential Options for Section 101**

Before examining the particular approaches introduced by the PTO and in the 116th Congress, this section will review some of the general ways in which Section 101 may or may not be reformed. These different paths are introduced to contextualize the current Section 101 reform proposals within the universe of possible reforms. This list is not exhaustive, nor are each of these options necessarily mutually exclusive.

At a general level, most of the proposed paths forward for Section 101 fall into one of four categories.\textsuperscript{225} First, some oppose any legislative intervention, proposing instead to allow the courts to continue to develop and refine the standards for patent eligibility.\textsuperscript{226} Second, some propose replacing the *Alice/Mayo* framework with an explicit list of subject matter that is patent-eligible or -ineligible, perhaps along the lines of an approach that is used for European patents.\textsuperscript{227} Third, some propose replacing the *Alice/Mayo* framework with a different, usually lower, standard for patent eligibility, such as a requirement that the invention result from human effort, exist outside the human mind, or contribute to the technological arts.\textsuperscript{228} Fourth, some propose to do away with any limitations on patentable subject matter, beyond the four statutory categories and other existing statutory patentability requirements.\textsuperscript{229}

---

\textsuperscript{90} (surveying religious and deontological bases for prohibition on patenting science, nature, and ideas); Tun-Jen Chiang, *Competing Visions of Patentable Subject Matter*, 82 GEO. \textsuperscript{228} See Taylor, supra note 225, at 2202-06; PTO PSM REPORT, supra note 16, at 41-43; BCLT Report, supra note 16, at 563-65.  
\textsuperscript{229} See, e.g., Risch, supra note 21, at 591-94; see generally “Requirements for Patentability” (reviewing requirements for patentability under Sections 102, 103, and 112 of the Patent Act).
Continued Common Law Judicial Development

One option is for Congress to leave Section 101 as it is, and allow the courts (and/or the PTO) to continue developing the law of patent-eligible subject matter. Stakeholders and commentators may support this option for several different reasons. Some may disagree that the Alice/Mayo framework is as indeterminate or as harmful to innovation as the critics claim. Other commentators, even if they accept the criticisms directed at Alice/Mayo, may nonetheless believe that the courts will eventually refine, clarify, or otherwise improve the law of patentable subject matter given more time for judicial development. Still other commentators support the current law of Section 101 as affirmatively good for innovation and society because it precludes property rights in fundamental aspects of science, nature, and ideas, or serves as an important mechanism to weed out overly broad patents or obtain early dismissal of unmeritorious patent litigation.

Supporters of continued judicial development may point to the recent administrative guidance put forth by the PTO and significant Section 101 decisions of the Federal Circuit over the past five years as promising steps in the administrative and common law development of Section 101 after the Alice, Mayo, and Myriad decisions. Opponents of maintaining the legal status quo, for their part, observe that the Supreme Court has not shown much interest in revisiting its Section 101 jurisprudence despite many opportunities, and that several current and former Federal Circuit judges have called for legislative amendment of Section 101.

Specific Statutory List of Included or Excluded Subject Matter Categories

Another potential route for reform would be to amend Section 101 to replace the Alice/Mayo framework with a more specific list of subject matter that is patent-eligible and/or patent-ineligible. Currently, Section 101 contains a broad list of included subject matter categories (processes, machines, manufactures, and compositions of matter), but most of the doctrine focuses on the three judicially created ineligible categories: laws of nature, natural phenomena, and abstract ideas. The “laundry list” approach would seek to make Section 101 clearer and more predictable by specifically defining categories of eligible and/or ineligible subject matter. Depending on how this sort of proposal is structured, it would retain the notion of ineligible classes of subject matter, but define such categories differently, more precisely, and perhaps more narrowly than the common law exceptions under the Alice/Mayo framework.

The European Patent Convention’s (EPC’s) approach to patent eligibility offers a potential model for this type of approach. Under EPC article 52(1), patent-eligible subject matter reaches “all fields of technology, provided that they are new, involve an inventive step and are susceptible of industrial application.” However, EPC article 52(2) defines specific subject matter that is not patentable when claimed “as such”:

(a) discoveries, scientific theories and mathematical methods;
(b) aesthetic creations;
(c) schemes, rules and methods for performing mental acts, playing games or doing business, and programs for computers;
(d) presentations of information.

EPC article 53 further denies patents on inventions that are “contrary to [public order] or morality,” or that claim “plant and animal varieties,” or “methods for treatment of the human or animal body by surgery or therapy and diagnostic methods practised on the human or animal body.”

Assuming that the new statutory categories are more clearly delineated than existing judicial categories like the “abstract idea” exception, a potential virtue of the laundry-list approach is greater clarity and predictability in the sort of inventions that are patentable when claimed “as such”:

246 Compare id. at 2193-97 (arguing that judicial “policymaking” under Section 101 should be constrained), with Morris, supra note 103, at 107-17 (arguing that an subjective, intuitive, case-by-case, judgment-based approach to
Replace Judicial Exceptions with a Different Standard

A third group of proposed Section 101 reforms seeks to replace the *Alice/Mayo* framework with a new statutory standard for assessing patent eligibility.247 Proposals in this category are fairly diverse, but common elements in proposed new standards would limit patent eligibility to inventions that

- result from human effort;248
- contribute to the technological arts;249
- have practical utility or application;250
- cannot be solely performed in the human mind;251
- do not preempt all practical uses of a law of nature, abstract idea, or natural phenomenon.252

Usually, the proposed new patentability standard would supersede the three judicially created subject matter exclusions and the two-step *Alice/Mayo* test.253

Several proposed new standards blend more than one of these elements. For example, the American Intellectual Property Law Association has submitted a Section 101 reform proposal that replaces the *Alice/Mayo* framework with a single exception to patent eligibility if an invention “exists in nature independently of and prior to any human activity” or “is performed solely in the human mind.”254 A 2017 proposal by the American Bar Association would explicitly allow patenting “practical applications” of laws of nature, natural phenomena, and abstract ideas, so long as the patent claim does not “preempt the use by others of all practical applications of the law of nature, natural phenomenon, or abstract idea.”255

It is difficult to generalize given the significant differences among the various proposals in this category, but commentators may debate whether proposed new standards would provide greater clarity and predictability in patent-eligibility law, while still being flexible enough to adapt to new technologies.256

256 See Taylor, supra note 225, at 2189-97 (articulating general principles for evaluating proposed Section 101 reforms).
Eliminate Implied Patentable Subject Matter Limits

A final option is to eliminate the *Alice*/Mayo framework and judicially created exceptions to patent eligibility altogether, without replacing them with a new standard. Several commentators have argued that patent-eligibility doctrine serves no purpose that is not already served by the existing statutory patentability requirements of utility, novelty, obviousness, written description, definiteness, and enablement. On this view, the appropriate course would be for Congress to simply eliminate the nonstatutory eligibility requirements (i.e., the judicial prohibitions on patenting laws of nature, natural phenomena, and abstract ideas) in favor of “rigorous” application of the patentability requirements of Sections 102, 103, and 112 of the Patent Act.

Supporters of this approach argue that it advances the underlying policy concerns motivating Section 101 law, but does so in a “more consistent and more rigorous” manner. Opponents argue that Section 101 serves important purposes that are distinct from the other patentability requirements, which would be lost if the judicial exceptions were entirely eliminated.

Proposed Reforms to Section 101

The Supreme Court’s recent patentable subject matter jurisprudence has inspired a number of proposed Section 101 reforms from academics, practitioners, and other stakeholders. The specifics of many of these proposals have been reviewed elsewhere. This section examines two major developments in this area in 2019. First, it reviews the PTO’s Revised Subject Matter Eligibility Guidance, which seeks to offer clearer guidelines to PTO patent examiners in making Section 101 determinations. Second, this section examines a series of draft legislative proposals put forth by a bipartisan and bicameral group of legislators, which have been the subject of a series of roundtables and congressional hearings on patentable subject matter reform.

PTO’s 2019 Patent Subject Matter Eligibility Guidance

On January 7, 2019, the PTO issued Revised Patent Subject Matter Eligibility Guidance (the PTO’s Revised Guidance) to assist PTO patent examiners in determining subject matter eligibility for patent applications. The PTO noted that the “legal uncertainty” surrounding the *Alice*/Mayo framework “poses unique challenges” for the agency, which has thousands of patent examiners who must make patent-eligibility determinations on hundreds of thousands of applications each

264 2019 PTO Section 101 Guidance, supra note 28.
Accordingly, the PTO issued revised guidance to its patent examiners to provide “more clarity and predictability” in their Section 101 determinations. The PTO’s Revised Guidance made two major changes to how patent examiners evaluate whether a patent application claims patent-ineligible subject matter. First, the guidance attempts to provide a clearer definition of what constitutes an ineligible “abstract idea.”

Previously, examiners would make that determination by comparing the patent claim at issue to those found to be ineligible “abstract ideas” in previous judicial cases. The PTO found that this approach had become “impractical” because of an expanding volume of sometimes contradictory Section 101 case law. The PTO’s Revised Guidance “synthesizes” the case law into three categories that examiners will treat as “abstract ideas”:

(a) Mathematical concepts—mathematical relationships, mathematical formulas or equations, mathematical calculations;

(b) Certain methods of organizing human activity—fundamental economic principles or practices (including hedging, insurance, mitigating risk); commercial or legal interactions (including agreements in the form of contracts; legal obligations; advertising, marketing or sales activities or behaviors; business relations); managing personal behavior or relationships or interactions between people (including social activities, teaching, and following rules or instructions); and

(c) Mental processes—concepts performed in the human mind (including an observation, evaluation, judgment, opinion).

Under the Revised Guidance, patent claims that do not recite matter that falls into one of these three groupings should not be treated as an “abstract idea” except in “rare circumstance[s].”

Second, the PTO’s Revised Guidance clarifies when examiners will treat a patent claim as “directed to” an ineligible category (abstract ideas, laws of nature, or natural phenomena) under step one of the Alice/Mayo test. In particular, the PTO will not treat a claim as “directed to” an ineligible concept if “the claim as a whole integrates the recited judicial exception into a practical application of the exception.” If the claim does integrate such a practical application—such as improving the functioning of a computer, effecting a particular treatment for a disease, or implementing the exception into a particular machine or manufacture—then the PTO will treat

the claim as patent-eligible, without having to examine the patent application for an “inventive concept” under step two of the Alice/Mayo framework. 275

PTO’s Revised Guidance was generally perceived as lowering Section 101 barriers to patentability, especially with respect to computer-related inventions. 276 Some commentators praised the Revised Guidance for providing greater clarity to patent examiners, while other stakeholders criticized the guidance as inconsistent with the Supreme Court’s Section 101 decisions. 277

Although the PTO’s Revised Guidance changes how PTO examiners review new patent applications, it is important to note that the guidance, unlike judicial decisions or statutory reforms, lacks formal legal force—that is, the guidance is not binding on the courts when patents are challenged in litigation. The PTO lacks general substantive rulemaking authority, 278 and Revised Guidance itself states that it is only a “tool for internal [PTO] management” that lacks “the force and effect of law.” 279 Although the Federal Circuit has issued somewhat contradictory signals on this point, 280 the Guidance would receive, at the most, “some deference” if a court found its reasoning to be persuasive. 281

281 United States v. Mead Corp., 533 U.S. 218, 234 (2001) (“[A]n agency’s interpretation [of a statute] may merit some deference whatever its form, given the specialized experience and broader investigations and information available to the agency, and given the value of uniformity in its administrative and judicial understandings of what a national law requires.”) (citations omitted); Skidmore v. Swift & Co., 323 U.S. 134, 140 (1944) (“The weight of [an informal agency] judgment in a particular case will depend upon the thoroughness evident in its consideration, the validity of its reasoning, its consistency with earlier and later pronouncements, and all those factors which give it power to persuade, if lacking power to control.”).
Legislative Efforts in the 116th Congress: The Tillis-Coons Proposals

The First Tillis-Coons Proposal

On April 17, 2019, Senators Tillis and Coons, along with Representatives Collins, Johnson, and Stivers, released a “bipartisan, bicameral framework” for legislative Section 101 reform (the First Tillis-Coons Proposal).282 The framework’s release followed multiple roundtables with patent law stakeholders on Section 101 and the impact of the Alice/Mayo framework on, for example, innovation in artificial intelligence, medical diagnostics, and personalized medicine.283

The First Tillis-Coons Proposal would have retained the four statutory categories of patentable inventions, but removed the requirement that the invention or discovery be “new and useful” from Section 101.284 Patent eligibility would have instead been determined “by considering each and every element of the claim as a whole and without regard for considerations properly addressed by [Sections] 102, 103 and 112 [of the Patent Act].”285

In place of the judicially created exceptions to patent eligibility, which the First Tillis-Coons Proposal would have abrogated by statute, the proposal would have defined, “in a closed list,” five “exclusive” categories of patent-ineligible subject matter: (1) fundamental scientific principles; (2) products that exist solely and exclusively in nature; (3) pure mathematical formulas; (4) economic or commercial principles; and (5) mental activities.286 Effectively, this would have codified the judicial exceptions in a narrower form, with the first two ineligible categories roughly corresponding to the “law of nature” and “natural product” judicial exceptions, and the final three to the types of “abstract ideas” identified by the PTO in its 2019 Guidance.287 The Proposal would have narrowed the construction of these ineligible categories by creating a “practical application” test,288 presumably along the lines of the ABA proposal to expressly permit patenting of a practical application of ineligible subject matter.289 However, “simply reciting generic technical language or generic functional language” would have been insufficient to “salvage an otherwise ineligible claim.”290

286 Id.
288 First Tillis-Coons Proposal, supra note 29.
289 See supra note 255 and accompanying text.
290 First Tillis-Coons Proposal, supra note 29.
The First Tillis-Coons Proposal thus blended elements of the PTO’s 2019 Revised Guidance with a “laundry list” approach of specific ineligible categories, plus new statutory standards for how to apply the list of exceptions to patentable subject matter.291 The overall effect would be to lower Section 101 barriers to patentability, while still retaining more narrowly defined classes of ineligible subject matter.292

Reactions to the First Tillis-Coons Proposal were mixed.293 Some argued that the draft proposal was a promising start for much-needed congressional intervention.294 On the pro-Alice side of the debate, the Electronic Frontier Foundation, for example, criticized the First Tillis-Coons Proposal as a “disaster” for innovation because it would eliminate a powerful tool to combat bad patents and patent troll litigation.295 On the other side of the debate, critics of the Alice/Mayo framework argued that the First Tillis-Coons Proposal did not go far enough, and urged elimination of any ineligible categories of patentable subject matter.296

The Second Tillis-Coons Proposal

On May 22, 2019, following feedback on their first draft framework, the same group of Members released a “draft bill” to reform Section 101 (the Second Tillis-Coons Proposal).297 The Second Tillis-Coons Proposal was released in advance of a series of three hearings held in June before the Senate Judiciary Committee’s Subcommittee on Intellectual Property, which were designed to solicit feedback on the draft legislative language.298 In the subsequent hearings, 45 witnesses testified over three days, with representatives from industry, academia, bar associations, and trade groups; former Federal Circuit Judges and PTO officers; and other patent law stakeholders expressing various views on Section 101 reform.299

291 See supra “Specific Statutory List of Included or Excluded Subject Matter Categories;” “PTO’s 2019 Patent Subject Matter Eligibility Guidance.” See also Nelson & Smith, supra note 287 (“[The First Tillis-Coons Proposal] includes some aspects of the proposals from several patent specialty associations, including those from the AIPLA/IPO, IPLAC, and the ABA-IPL section.”).

292 See Daniel T. Taskalos, Returning to the Status Quo?—Proposed Outline for Section 101 Reform, Nat’l. L. Rev., Apr. 22, 2019, https://www.natlawreview.com/article/returning-to-status-quo-proposed-outline-section-101-reform (“In all, the proposed framework appears to focus on returning the 101 analysis to its previous status as more of a low hurdle to patentability, but a hurdle nonetheless.”).

298 Id.

299 See generally Coons & Tillis, supra note 31. For a succinct summary of the main views expressed at the hearings, see Bruce M. Wexler et al., Senate Hearing on “The State of Patent Eligibility in America”: Analysis of Viewpoints on Looming Section 101 Change, PAUL HASTINGS, June 25, 2019, https://www.paulhastings.com/publications-items/details/?id=c58c536d-2334-6428-811c-ff00004cbedd. For a more detailed witness-by-witness breakdown, see
As compared to the first proposal, the Second Tillis-Coons Proposal, generally speaking, would make more sweeping changes to Section 101 to expand patent eligibility. Like the First Tillis-Coons Proposal, the draft bill has several provisions that would attempt to separate the Section 101 inquiry from other patentability requirements. Specifically, the draft bill would strike the word “new” from Section 101 and establish that patent subject matter eligibility must be determined “considering the claimed invention as a whole” and without regard to “considerations relating to section 102, 103, or 112 of [the Patent Act].” The Second Tillis-Coons Proposal would further provide that eligibility determinations shall not depend on the “manner in which the claimed invention was made; whether individual limitations of a claim are well known, conventional or routine; the state of the art at the time of the invention.” The draft bill also explicitly provides that Section 101 “shall be construed in favor of eligibility.”

Instead of codifying and narrowing the judicial exceptions to patentability, the Second Tillis-Coons Proposal would eliminate them altogether. The draft bill provides that

No implicit or other judicially created exceptions to subject matter eligibility, including “abstract ideas,” “laws of nature,” or “natural phenomena,” shall be used to determine patent eligibility under section 101, and all cases establishing or interpreting those exceptions to eligibility are hereby abrogated.

This language would appear to overturn by statute not only the Alice/Mayo framework, but over two centuries of judicial decisions interpreting the “common law” exceptions to Section 101.

The Second Tillis-Coons Proposal would replace the judicial exceptions with a new statutory definition of utility that incorporates elements of various prior proposals for a new Section 101 standard. To be patent-eligible subject matter under the Second Tillis-Coons Proposal, the invention would need to fit into one of the four statutory categories of eligible subject matter (which remain unchanged) and be “useful.” To be “useful,” an invention or discovery would need to provide “specific and practical utility in any field of technology through human intervention.”

Finally, to combat overbroad patent claims, the Second Tillis-Coons Proposal would alter the functional claiming rules under Section 112(f), which permits patentees to claim their invention in functional terms as opposed to reciting specific physical structures. In particular, the draft bill provides that if any patent claim element is “expressed as a specified function without the recital of structure, material, or acts in support thereof,” then that claim element will be limited to the “corresponding structure, material, or acts described in the specification” and their

304 See supra “Historical Development of the Judicial Exceptions to Patent-Eligible Subject Matter.”

305 See supra “Replace Judicial Exceptions with a Different Standard”; “Section 101: Utility.”

306 See Second Tillis-Coons Proposal, supra note 30 (proposed § 101(a)).

307 See id. (proposed § 100(k)). The draft bill does not further define “practical utility,” “field of technology,” or “human intervention.”

308 See Coons & Tillis, supra note 31 (indicating that the Section 112(f) amendments were intended “to guard against . . . overly broad, functional patent claims”); see generally “Section 112(f): Functional Claiming” (summarizing current law of functional claiming).
equivalents. Consistent with a recent decision of the Federal Circuit, this language would clarify that Section 112(f) applies to any claim element that fails to sufficiently recite a structure for performing a function. This change would arguably make it more difficult for a patentee to avoid the limiting effects of Section 112(f), even if the words “means for” are not used in the claim language.

As with the first proposal, reactions to the Second Tillis-Coons Proposal from patent law stakeholders were mixed. Critics of the Alice/Mayo framework generally applauded the draft bill as bringing much needed clarity and certainty to the law of patent eligibility, particularly with respect to biotechnology innovation. Opponents of the draft bill expressed concern that changes to the Alice/Mayo framework would eliminate an important tool against unmeritorious patent litigation. Critics also questioned the necessity and advisability of such a sweeping change to Section 101 law. Both supporters and opponents raised concerns about potential ambiguities in the proposed definition of “useful,” particularly the terms “human intervention,” “practical utility,” and “field of technology.”

309 Second Tillis-Coons Proposal, supra note 30 (proposed § 112(f)).
310 Williamson v. Citrix Online, LLC, 792 F.3d 1339 (Fed. Cir. 2015) (en banc).
312 See Patent Eligibility Hearings, supra note 31 (statement of David W. Jones, Executive Director, High Tech Inventors Alliance), at 12, https://www.judiciary.senate.gov/download/hill-testimony ([hereinafter Jones Testimony] (“The proposed Section 112(f) amendment represents a modest improvement over the current language and will eliminate lingering arguments about the effect of inclusion or omission of the words “means for” and whether particular terms should be interpreted as functional in the wake of [Williamson v. Citrix].”)).
313 See generally Wexler et al., supra note 299 (summarizing arguments made by supporters and opponents of the Second Tillis-Coons Proposal).
315 See, e.g., Patent Eligibility Hearings, supra note 31 (statement of Laurie Hill, Vice President, Intellectual Property, Genentech, Inc.), at 8, 15-16, https://www.judiciary.senate.gov/download/hill-testimony (supporting the Second Tillis-Coons Proposal as “a strong step in the right direction” because of the “present uncertainty surrounding Section 101 [that] threatens to disrupt the development of a wide range of important medicines, diagnostics, treatments, and other innovations that benefit society”).
316 See, e.g., Gugliuzza Testimony, supra note 233, at 6-7 (arguing that “completely dismantling the eligibility requirement would take away a crucial tool courts can use to end, at relatively low cost, patent cases that plainly lack merit.”).
317 See, e.g., Jones Testimony, supra note 312, at 7 (“The evidence and arguments that have been advanced by proponents [of Section 101 reform] simply do not provide any reasonable justification for . . . the complete abrogation of two centuries of eligibility case law.”).
318 See, e.g., Dickinson Testimony, supra note 314, at 33-34; Jones Testimony, supra note 312, at 10-11.
Stakeholders also debated the specific practical effects of the legislative changes at the hearings, such as the effect of elimination of the judicial exceptions on basic scientific research. One notable concern, raised by the American Civil Liberties Union in opposition to the draft bill, was that the Second Tillis-Coons Proposal, by abrogating the Myriad decision, would permit the patenting of human genes. Several witnesses denied that the draft bill would lead to that result because of the bill’s “human intervention” requirement or other patent law principles. For their part, Senators Tillis and Coons made clear that they have “no intention” of overruling the holding of Myriad that no one may patent “genes as they exist in the human body.”

Following the hearings, Senators Tillis and Coons indicated that what they heard reinforced their view that “patent eligibility is broken and desperately needs to be repaired,” and that there is a “necessity for Congress to intervene” to bring greater clarity to Section 101. Moving forward, they indicated they were “considering a provision that would exempt research and experimentation from infringement liability” in response to concerns about inhibiting scientific research. The Senators also indicated that they would continue to welcome input from all stakeholders and would seek to “clarify” the proposal regarding the eligibility of gene patents, and potentially “sharpen the ‘field of technology’ requirement to ensure that critical advances like artificial intelligence and medical diagnostics qualify [as patent-eligible].” At the same time, the Senators expressed their view that certain concepts should remain patent-ineligible under a revised Section 101, such as “economic transactions or social interactions.” Observers expect a revised formal bill reflecting these provisions this fall.

The Congressional Research Service (CRS) is a federal legislative branch agency, housed inside the Library of Congress, charged with providing the United States Congress non-partisan advice on issues that may come before Congress.

EveryCRSReport.com republishes CRS reports that are available to all Congressional staff. The reports are not classified, and Members of Congress routinely make individual reports available to the public.

Prior to our republication, we redacted phone numbers and email addresses of analysts who produced the reports. We also added this page to the report. We have not intentionally made any other changes to any report published on EveryCRSReport.com.

CRS reports, as a work of the United States government, are not subject to copyright protection in the United States. Any CRS report may be reproduced and distributed in its entirety without permission from CRS. However, as a CRS report may include copyrighted images or material from a third party, you may need to obtain permission of the copyright holder if you wish to copy or otherwise use copyrighted material.

Information in a CRS report should not be relied upon for purposes other than public understanding of information that has been provided by CRS to members of Congress in connection with CRS' institutional role.

EveryCRSReport.com is not a government website and is not affiliated with CRS. We do not claim copyright on any CRS report we have republished.
